

# Package ‘elmNNRcpp’

July 22, 2025

**Type** Package

**Title** The Extreme Learning Machine Algorithm

**Version** 1.0.4

**Date** 2022-01-27

**BugReports** <https://github.com/mlampros/elmNNRcpp/issues>

**URL** <https://github.com/mlampros/elmNNRcpp>

## Description

Training and predict functions for Single Hidden-layer Feedforward Neural Networks (SLFN) using the Extreme Learning Machine (ELM) algorithm. The ELM algorithm differs from the traditional gradient-based algorithms for very short training times (it doesn't need any iterative tuning, this makes learning time very fast) and there is no need to set any other parameters like learning rate, momentum, epochs, etc. This is a reimplementation of the 'elmNN' package using 'RcppArmadillo' after the 'elmNN' package was archived. For more information, see ``Extreme learning machine: Theory and applications'' by Guang-Bin Huang, Qin-Yu Zhu, Chee-Kheong Siew (2006), Elsevier B.V, <[doi:10.1016/j.neucom.2005.12.126](https://doi.org/10.1016/j.neucom.2005.12.126)>.

**License** GPL (>= 2)

**Encoding** UTF-8

**Depends** R(>= 3.0.2), KernelKnn

**Imports** Rcpp (>= 0.12.17)

**LinkingTo** Rcpp, RcppArmadillo (>= 0.8)

**Suggests** testthat, covr, knitr, rmarkdown

**VignetteBuilder** knitr

**RoxygenNote** 7.1.2

**NeedsCompilation** yes

**Author** Lampros Mouselimis [aut, cre] (ORCID:

---

elm	<i>Fit an extreme learning model</i>
-----	--------------------------------------

---

### Description

Formula interface for `elm_train`, transforms a data frame and formula into the necessary input for `elm_train`, automatically calls `onehot_encode` for classification.

### Usage

```
elm(
  formula,
  data,
  nhid,
  actfun,
  init_weights = "normal_gaussian",
  bias = FALSE,
  moorep_pseudoinv_tol = 0.01,
  leaky_relu_alpha = 0,
  seed = 1,
  verbose = FALSE
)
```

### Arguments

<code>formula</code>	formula used to specify the regression or classification.
<code>data</code>	data.frame with the data
<code>nhid</code>	a numeric value specifying the hidden neurons. Must be $\geq 1$
<code>actfun</code>	a character string specifying the type of activation function. It should be one of the following : 'sig' ( <code>sigmoid</code> ), 'sin' ( <code>sine</code> ), 'radbas' ( <code>radial basis</code> ), 'hardlim' ( <code>hard-limit</code> ), 'hardlims' ( <code>symmetric hard-limit</code> ), 'satlins' ( <code>satlins</code> ), 'tansig' ( <code>tan-sigmoid</code> ), 'tribas' ( <code>triangular basis</code> ), 'relu' ( <code>rectifier linear unit</code> ) or 'purelin' ( <code>linear</code> )

init_weights	a character string specifying the distribution from which the <i>input-weights</i> and the <i>bias</i> should be initialized. It should be one of the following : 'normal_gaussian' ( <i>normal / Gaussian distribution with zero mean and unit variance</i> ), 'uniform_positive' ( <i>in the range [0,1]</i> ) or 'uniform_negative' ( <i>in the range [-1,1]</i> )
bias	either TRUE or FALSE. If TRUE then <i>bias</i> weights will be added to the hidden layer
moorep_pseudoinv_tol	a numeric value. See the references web-link for more details on <i>Moore-Penrose pseudo-inverse</i> and specifically on the <i>pseudo inverse tolerance value</i>
leaky_relu_alpha	a numeric value between 0.0 and 1.0. If 0.0 then a simple <i>relu</i> ( $f(x) = 0.0$ for $x < 0$ , $f(x) = x$ for $x \geq 0$ ) activation function will be used, otherwise a <i>leaky-relu</i> ( $f(x) = \alpha * x$ for $x < 0$ , $f(x) = x$ for $x \geq 0$ ). It is applicable only if <i>actfun</i> equals to 'relu'
seed	a numeric value specifying the random seed. Defaults to 1
verbose	a boolean. If TRUE then information will be printed in the console

## Value

elm object which can be used with predict, residuals and fitted.

## Examples

```
elm(Species ~ ., data = iris, nhid = 20, actfun="sig")
mod_elm <- elm(Species ~ ., data = iris, nhid = 20, actfun="sig")

# predict classes
predict(mod_elm, newdata = iris[1:3,-5])

# predict probabilities
predict(mod_elm, newdata = iris[1:3,-5], type="prob")

# predict elm output
predict(mod_elm, newdata = iris[1:3,-5], type="raw")

data("Boston")
elm(medv ~ ., data = Boston, nhid = 40, actfun="relu")

data("ionosphere")
elm(class ~ ., data = ionosphere, nhid=20, actfun="relu")
```

<i>elm_predict</i>	<i>Extreme Learning Machine predict function</i>
--------------------	--

## Description

Extreme Learning Machine predict function

## Usage

```
elm_predict(elm_train_object, newdata, normalize = FALSE)
```

## Arguments

<i>elm_train_object</i>	it should be the output of the <i>elm_train</i> function
<i>newdata</i>	an input matrix with number of columns equal to the <i>x</i> parameter of the <i>elm_train</i> function
<i>normalize</i>	a boolean specifying if the output predictions <i>in case of classification</i> should be normalized. If TRUE then the values of each row of the output-probability-matrix that are less than 0 and greater than 1 will be pushed to the [0,1] range

## Examples

```
library(elmNNRcpp)

#-----
# Regression
#-----

data(Boston, package = 'KernelKnn')

Boston = as.matrix(Boston)
dimnames(Boston) = NULL

x = Boston[, -ncol(Boston)]
y = matrix(Boston[, ncol(Boston)], nrow = length(Boston[, ncol(Boston)]), ncol = 1)

out_regr = elm_train(x, y, nhid = 20, actfun = 'purelin', init_weights = 'uniform_negative')

pr_regr = elm_predict(out_regr, x)

#-----
# Classification
#-----

data(ionosphere, package = 'KernelKnn')

x_class = ionosphere[, -c(2, ncol(ionosphere))]
```

```

x_class = as.matrix(x_class)
dimnames(x_class) = NULL

y_class = as.numeric(ionosphere[, ncol(ionosphere)])

y_class_onehot = onehot_encode(y_class - 1)      # class labels should begin from 0

out_class = elm_train(x_class, y_class_onehot, nhid = 20, actfun = 'relu')

pr_class = elm_predict(out_class, x_class, normalize = TRUE)

```

**elm\_train***Extreme Learning Machine training function***Description**

Extreme Learning Machine training function

**Usage**

```

elm_train(
  x,
  y,
  nhid,
  actfun,
  init_weights = "normal_gaussian",
  bias = FALSE,
  moorep_pseudoinv_tol = 0.01,
  leaky_relu_alpha = 0,
  seed = 1,
  verbose = FALSE
)

```

**Arguments**

<b>x</b>	a matrix. The columns of the input matrix should be of type numeric
<b>y</b>	a matrix. In case of regression the matrix should have $n$ rows and $1$ column. In case of classification it should consist of $n$ rows and $n$ columns, where $n > 1$ and equals to the number of the unique labels.
<b>nhid</b>	a numeric value specifying the hidden neurons. Must be $>= 1$
<b>actfun</b>	a character string specifying the type of activation function. It should be one of the following : 'sig' ( <i>sigmoid</i> ), 'sin' ( <i>sine</i> ), 'radbas' ( <i>radial basis</i> ), 'hardlim' ( <i>hard-limit</i> ), 'hardlims' ( <i>symmetric hard-limit</i> ), 'satlims' ( <i>satlims</i> ), 'tansig' ( <i>tan-sigmoid</i> ), 'tribas' ( <i>triangular basis</i> ), 'relu' ( <i>rectifier linear unit</i> ) or 'purelin' ( <i>linear</i> )

<code>init_weights</code>	a character string specifying the distribution from which the <i>input-weights</i> and the <i>bias</i> should be initialized. It should be one of the following : 'normal_gaussian' ( <i>normal / Gaussian distribution with zero mean and unit variance</i> ), 'uniform_positive' ( <i>in the range [0,1]</i> ) or 'uniform_negative' ( <i>in the range [-1,1]</i> )
<code>bias</code>	either TRUE or FALSE. If TRUE then <i>bias</i> weights will be added to the hidden layer
<code>moorep_pseudoinv_tol</code>	a numeric value. See the references web-link for more details on <i>Moore-Penrose pseudo-inverse</i> and specifically on the <i>pseudo inverse tolerance value</i>
<code>leaky_relu_alpha</code>	a numeric value between 0.0 and 1.0. If 0.0 then a simple <i>relu</i> ( $f(x) = 0.0$ for $x < 0$ , $f(x) = x$ for $x \geq 0$ ) activation function will be used, otherwise a <i>leaky-relu</i> ( $f(x) = \alpha * x$ for $x < 0$ , $f(x) = x$ for $x \geq 0$ ). It is applicable only if <i>actfun</i> equals to 'relu'
<code>seed</code>	a numeric value specifying the random seed. Defaults to 1
<code>verbose</code>	a boolean. If TRUE then information will be printed in the console

## Details

The input matrix should be of type numeric. This means the user should convert any *character*, *factor* or *boolean* columns to numeric values before using the *elm\_train* function

## Examples

```

library(elmNNRcpp)

#-----
# Regression
#-----

data(Boston, package = 'KernelKnn')

Boston = as.matrix(Boston)
dimnames(Boston) = NULL

x = Boston[, -ncol(Boston)]
y = matrix(Boston[, ncol(Boston)], nrow = length(Boston[, ncol(Boston)]), ncol = 1)

out_regr = elm_train(x, y, nhid = 20, actfun = 'purelin', init_weights = 'uniform_negative')

```

```
#-----
# Classification
#-----

data(ionosphere, package = 'KernelKnn')

x_class = ionosphere[, -c(2, ncol(ionosphere))]
x_class = as.matrix(x_class)
dimnames(x_class) = NULL

y_class = as.numeric(ionosphere[, ncol(ionosphere)])

y_class_onehot = onehot_encode(y_class - 1)      # class labels should begin from 0

out_class = elm_train(x_class, y_class_onehot, nhid = 20, actfun = 'relu')
```

---

**onehot\_encode**

*One-hot-encoding of the labels in case of classification*

---

**Description**

One-hot-encoding of the labels in case of classification

**Usage**

```
onehot_encode(y)
```

**Arguments**

y	a numeric vector consisting of the response variable labels. The minimum value of the unique labels should begin from 0
---	---

**Examples**

```
library(elmNNRcpp)

y = sample(0:3, 100, replace = TRUE)

y_expand = onehot_encode(y)
```

---

**predict.elm***Predict with elm*

---

**Description**

Wrapper for [elm\\_predict](#).

**Usage**

```
## S3 method for class 'elm'  
predict(object, newdata, type = c("class", "prob", "raw"), ...)
```

**Arguments**

object	elm model fitted with <a href="#">elm</a> .
newdata	data.frame with the new data
type	only used with classification, can be either "class", "prob", "raw", which are class (vector), probability (matrix) or the output of the elm function (matrix).
...	not used

**Value**

predicted values
