

# Package ‘fedstatAPIr’

July 22, 2025

**Title** Unofficial API for Fedstat (Rosstat EMISS System) for Automatic and Efficient Data Queries

**Version** 1.0.3

**Description** An API for automatic data queries to the fedstat <<https://www.fedstat.ru>>, using a small set of functions with a common interface.

**License** MIT + file LICENSE

**URL** <https://github.com/DenchPokepon/fedstatAPIr>

**BugReports** <https://github.com/DenchPokepon/fedstatAPIr/issues>

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.2.3

**Imports** httr, jsonlite, xml2, readsdmx, magrittr, utils, methods, data.table

**Depends** R (>= 2.10)

**NeedsCompilation** no

**Author** Denis Krylov [aut, cre],  
Dmitry Kibalnikov [aut]

**Maintainer** Denis Krylov <deniskrylovvit@gmail.com>

**Repository** CRAN

**Date/Publication** 2023-03-30 08:30:02 UTC

---

fedstat\_data\_ids\_filter

*Filters data\_ids based on filters that are given in JSON format*

---

## Description

Filters indicator data\_ids with given filters taking into account possible filters specification errors and default filters.

filters should use filter\_field\_title in names and filter\_value\_title in values as they are presented on fedstat.ru. If for some reason the specified filters do not return the expected result, it is worth inspecting possible filter values in data\_ids to see if the strings are defined correctly (e.g. encoding issues, mixing latin and cyrillic symbols)

filter\_value\_title currently supports the following special values:

1. asterix (\*), it's alias for "select all possible filter values for this filter field"

Unspecified filters use asterix as a default (i.e. all possible filter values are selected and a warning is given)

Internally normalized filter\_field\_title and filter\_value\_title are used (all lowercase, removed extra whitespaces) to compare the equality of data\_ids and filters

## Usage

```
fedstat_data_ids_filter(data_ids, filters = list(), disable_warnings = FALSE)
```

## Arguments

data\_ids      data.frame, result of fedstat\_get\_data\_ids with or without conjunction with fedstat\_get\_data\_ids\_special\_cases\_handle

filters      JSON in R list form. The structure should be like this:

```
{
  "filter_field_title1": ["filter_value_title1", "filter_value_title2"],
  "filter_field_title2": ["filter_value_title1", "filter_value_title2"],
  ...
}
```

Where for example filter\_field\_title1 could be a string "Year" with filter\_value\_title1 equal to 2020 and filter\_field\_title2 could be a string "OKATO" with filter\_value\_title1 equal to "Russian Federation" Not actual filter field titles and filter values titles because of ASCII requirement for CRAN

disable\_warnings

bool, enables or disables following warnings:

1. About non matched filter\_value\_title in filters and filter\_value\_title from data\_ids;
2. About unspecified filter\_field\_title in filters.

**Value**

data.frame, filtered data\_ids

**See Also**

[fedstat\\_get\\_data\\_ids](#), [fedstat\\_post\\_data\\_ids\\_filtered](#)

**Examples**

```
## Not run:
# Get data filters identifiers for CPI
# filter the data_ids to get data for january of 2023
# for all goods and services for Russian Federation
data_ids_filtered <- fedstat_get_data_ids("31074") %>%
  fedstat_data_ids_filter(
    filters = list(
      "Territory" = "Russian Federation",
      "Year" = "2023",
      "Period" = "January",
      "Types of goods and services" = "*"
    )
  )

# Not actual filter field titles and filter values titles because of ASCII requirement for CRAN

## End(Not run)
```

---

fedstat\_data\_load\_with\_filters

*Download subset of indicator data from fedstat.ru by specifying filters in JSON*

---

**Description**

This function is a wrapper for the other functions of the package to provide a simple one function API for fedstat.ru

There are two basic terms in this API: `filter_field` and `filter_value`

The `filter_field` reflects the individual property of the data point. For example, Year, Region, Unit of measurement, etc. Each filter field has its own title (`filter_field_title`), it is simply a human-readable word or phrase (e.g. "Year", "Region") that reflects the essence of the property by which filtering takes place

The `filter_value` reflects the individual property specific value of the data point. (e.g. 2021 for the Year, "Russian Federation" for the region, etc.) It also has a title (`filter_value_title`) with the same purpose as `filter_field_title`

filters should use `filter_field_title` in names and `filter_value_title` in values as they are presented on fedstat.ru. If for some reason the specified filters do not return the expected result, it

is worth using `fedstat_get_data_ids` separately and inspecting possible filter values in `data_ids` to see if the strings are defined correctly (e.g. encoding issues, mixing latin and cyrillic symbols)

`filter_value_title` currently supports the following special values:

1. asterix (\*), alias for "select all possible filter values for this filter field"

Unspecified filters use asterix as a default (i.e. all possible filter values are selected and a warning is given)

Internally normalized `filter_field_title` and `filter_value_title` are used (all lowercase, removed extra whitespaces) to compare the equality of `data_ids` and `filters`

## Usage

```
fedstat_data_load_with_filters(
  indicator_id,
  ...,
  filters = list(),
  timeout_seconds = 180,
  retry_max_times = 3,
  disable_warnings = FALSE,
  httr_verbose = NULL,
  loading_steps_verbose = TRUE,
  return_type = c("data", "dictionary"),
  try_to_parse_ObsValue = TRUE
)
```

## Arguments

`indicator_id` character, indicator id/code from indicator URL. For example for indicator with URL <https://www.fedstat.ru/indicator/37426> indicator id will be 37426

`...` other arguments passed to `httr::GET` and `httr::POST`

`filters` JSON in R list form. The structure should be like this:

```
{
  "filter_field_title1": ["filter_value_title1", "filter_value_title2"],
  "filter_field_title2": ["filter_value_title1", "filter_value_title2"],
  ...
}
```

Where for example `filter_field_title1` could be a string "Year" with `filter_value_title1` equal to 2020 and `filter_field_title2` could be a string "OKATO" with `filter_value_title1` equal to "Russian Federation" Not actual filter field titles and filter values titles because of ASCII requirement for CRAN

`timeout_seconds`

numeric, maximum time before a new GET and POST request is tried

`retry_max_times`

numeric, maximum number of tries to GET and POST `data_ids`

`disable_warnings`

bool, enables or disables following warnings:

1. About non matched filter\_value\_title in filters and filter\_value\_title from data\_ids;  
 2. About unspecified filter\_filed\_title in filters.

httr\_verbose httr::verbose() or NULL, outputs messages to the console about the processing of the request

loading\_steps\_verbose logical, print data loading steps to console

return\_type character, "data" or "dictionary", data for actual data, dictionary for sdmx lookup table (full data codes dictionary)

try\_to\_parse\_ObsValue logical, try to parse ObsValue column from character to R numeric type

### Value

data.frame with filtered indicator data from fedstat.ru

### See Also

[fedstat\\_get\\_data\\_ids](#), [fedstat\\_data\\_ids\\_filter](#), [fedstat\\_post\\_data\\_ids\\_filtered](#), [fedstat\\_parse\\_sdmx\\_to](#)

### Examples

```
## Not run:
# Download CPI data
# for all goods and services for Russian Federation
data <- fedstat_data_load_with_filters(
  indicator_id = "31074",
  filters = list(
    "Territory" = "Russian Federation",
    "Year" = "2023",
    "Period" = "January",
    "Types of goods and services" = "*"
  )
)
# Not actual filter field titles and filter values titles because of ASCII requirement for CRAN

## End(Not run)
```

---

fedstat\_get\_data\_ids    *Get data filters ids from fedstat.ru indicator web page*

---

### Description

To query data from fedstat we need to POST some filters in form of filter numeric identifiers. Most filters don't have some rule from which their ids can be generated based on filters titles and values. It seems like these ids are just indexes in the fedstat inner database. So in order to get the data, we first need to get the ids of the filter values by parsing specific part of java script source code on indicator web page.

**Usage**

```

fedstat_get_data_ids(
  indicator_id,
  ...,
  timeout_seconds = 180,
  retry_max_times = 3,
  httr_verbose = NULL
)

```

**Arguments**

|                              |                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>indicator_id</code>    | character, indicator id/code from indicator URL. For example for indicator with URL <a href="https://www.fedstat.ru/indicator/37426">https://www.fedstat.ru/indicator/37426</a> indicator id will be 37426 |
| <code>...</code>             | other arguments passed to <code>httr::GET</code>                                                                                                                                                           |
| <code>timeout_seconds</code> | numeric, maximum time before a new GET request is tried                                                                                                                                                    |
| <code>retry_max_times</code> | numeric, maximum number of tries to GET <code>data_ids</code>                                                                                                                                              |
| <code>httr_verbose</code>    | <code>httr::verbose()</code> or <code>NULL</code> , outputs messages to the console about the processing of the request                                                                                    |

**Details**

It is known that the fedstat lags quite often. Sometimes site never responds at all. This is especially true for the most popular indicators web pages. In this regard, by default, a GET request is sent 3 times with a timeout of 180 seconds and with initially small, but growing exponentially, pauses between requests.

As a rule, requests to the indicator web page take much longer than requests to get the data itself. A POST request for data is sent to a single URL [https://www.fedstat.ru/indicator/data.do?format=\(excel or sdmx\)](https://www.fedstat.ru/indicator/data.do?format=(excel or sdmx)) for all indicators and is often quite fast. In this regard, for many indicators, it makes sense to cache `data_ids` to increase the speed of data download. This is not possible for all data, for example, for weekly prices, each new week adds a new filter (new week), the id of which can only be found on the indicator web page. But for most data (e.g. monthly frequency), time filters are trivial. There are 12 months in total with unique ids that do not change and year ids that match their values (that is, `filter_value_id = filter_value`, in other words 2020 = 2020)

Correct `filter_field_object_ids` are needed to get data. For the sdmx format, these ids do not change anything, except for the standard data sorting, but their incorrect specification will lead either to incomplete data loading or to no data at all. For the excel format, these ids determine the form of data presentation, as in the data preview on the fedstat site. For now only default `filter_field_object_ids` are used, which are parsed from java script source code on indicator web page. Users can specify `filter_field_object_ids` for each `filter_field` in resulting `data_ids` table.

**Value**

data.frame with all character type columns:

1. `filter_field_id` - id for filter field;

2. filter\_field\_title - filter field title string representation;
3. filter\_value\_id - id for filter field value;
4. filter\_value\_title - filter field value title string representation;
5. filter\_field\_object\_ids - special strings that define the location of the filters fields. It can take the following values: lineObjectIds (filters in lines), columnObjectIds (filters in columns), filterObjectIds (hidden filters for all data);

### See Also

[fedstat\\_data\\_ids\\_filter](#), [fedstat\\_post\\_data\\_ids\\_filtered](#)

### Examples

```
## Not run:
# Get data filters identifiers for CPI
data_ids <- fedstat_get_data_ids("31074")

## End(Not run)
```

---

fedstat\_indicators\_names\_database

*Database of all indicator names presented on the fedstat.ru with hierarchical grouping*

---

### Description

Allows researchers to search for interesting indicators more easily

### Usage

```
fedstat_indicators_names_database
```

### Format

A data frame with 9335 rows and 10 variables:

**name** indicator name

**url** indicator url

**excluded** boolean, TRUE if indicator is not used and updated anymore

**department** the name of the department from which the data is coming from

**group\_level\_2** grouping of indicator

**group\_level\_3** grouping of indicator

**group\_level\_4** grouping of indicator

**group\_level\_5** grouping of indicator

**group\_level\_6** grouping of indicator

**date\_of\_update** date of the last update of the current database

**Source**

<https://fedstat.ru/organizations/>

---

fedstat\_indicator\_info

*Download indicator information*

---

**Description**

Download indicator information from <https://www.fedstat.ru/organizations/>  
Result table contains fedstat indicator id which is needed to request fedstat data  
Indicator with condition hidden == TRUE shows disabled records in fedstat hence ones might not be requested

**Usage**

```
fedstat_indicator_info()
```

**Value**

data.frame

**See Also**

[fedstat\\_get\\_data\\_ids](#)

**Examples**

```
## Not run:  
Get all indicator info  
get_indicators()  
  
## End(Not run)
```

---

fedstat\_parse\_sdmx\_to\_table

*Parse sdmx raw bytes to data.frame*

---

**Description**

Parses sdmx raw bytes received in response to POST request. This function is a wrapper around `readsdmx::read_sdmx`, in addition to reading data, automatically adds columns with values from lookup tables. Can also return full data codes dictionary for the indicator

**Usage**

```
fedstat_parse_sdmx_to_table(
  data_raw,
  return_type = c("data", "dictionary"),
  try_to_parse_ObsValue = TRUE
)
```

**Arguments**

|                                    |                                                                                                                        |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>data_raw</code>              | sdmx raw bytes                                                                                                         |
| <code>return_type</code>           | character, "data" or "dictionary", data for actual data, dictionary for sdmx lookup table (full data codes dictionary) |
| <code>try_to_parse_ObsValue</code> | logical, try to parse ObsValue column from character to R numeric type                                                 |

**Value**

data.frame

**See Also**

[fedstat\\_parse\\_sdmx\\_to\\_table](#)

**Examples**

```
## Not run:
# Get data filters identifiers for CPI
# filter the data_ids to get data for january of 2023
# for all goods and services for Russian Federation
# POST filters and download data in sdmx format
# Parse raw sdmx to data.frame
data <- fedstat_get_data_ids("31074") %>%
  fedstat_data_ids_filter(
    filters = list(
      "Territory" = "Russian Federation",
      "Year" = "2023",
      "Period" = "January",
      "Types of goods and services" = "*"
    )
  ) %>%
  fedstat_post_data_ids_filtered() %>%
  fedstat_parse_sdmx_to_table()

# Not actual filter field titles and filter values titles because of ASCII requirement for CRAN

## End(Not run)
```

---

fedstat\_post\_data\_ids\_filtered

*Post data filters ids to fedstat.ru and download specified subset of data*

---

## Description

Creates a request body from data\_ids and sends it to [https://www.fedstat.ru/indicator/data.do?format=data\\_format](https://www.fedstat.ru/indicator/data.do?format=data_format). Gets an sdmx or excel with data in binary format.

sdmx raw bytes can be passed to fedstat\_parse\_sdmx\_to\_table to create a data.frame or to rawToChar and writeLines to create an xml file

excel raw bytes can be passed to writeBin to create an xls file

## Usage

```
fedstat_post_data_ids_filtered(
  data_ids,
  ...,
  data_format = c("sdmx", "excel"),
  timeout_seconds = 180,
  retry_max_times = 3,
  httr_verbose = NULL
)
```

## Arguments

|                 |                                                                                                                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data_ids        | data.frame, can be a result of fedstat_get_data_ids or fedstat_get_data_ids_special_cases_hano to download all available data, or a result of fedstat_data_ids_filter to download subset of available data |
| ...             | other arguments passed to httr::POST                                                                                                                                                                       |
| data_format     | string, one of sdmx, excel                                                                                                                                                                                 |
| timeout_seconds | numeric, maximum time before a new POST request is tried                                                                                                                                                   |
| retry_max_times | numeric, maximum number of tries to POST data_ids                                                                                                                                                          |
| httr_verbose    | httr::verbose() or NULL, outputs messages to the console about the processing of the request                                                                                                               |

## Value

raw bytes (sdmx or excel)

## See Also

```

---

 parse\_js1

---

*Get data ids from java script source*

---

**Description**

Get data ids from java script source

**Usage**

```
parse_js1(script)
```

**Arguments**

script                      character, java script source code with data ids

**Value**

json in form of list with data ids

---

`parse_js2`*Get default data ids object ids from java script source*

---

**Description**

Get default data ids object ids from java script source

**Usage**

```
parse_js2(script)
```

**Arguments**

`script`            character, java script source code with data ids and default object ids in it

**Value**

json in form of list with 3 character vectors for `lineObjectIds`, `columnObjectIds`, `filterObjectIds`, which consist of `filters_id`

# Index
