

Package ‘ramify’

July 23, 2025

Type Package

Title Additional Matrix Functionality

Version 0.4.0

Description Additional matrix functionality for R including: (1) wrappers for the base matrix function that allow matrices to be created from character strings and lists (the former is especially useful for creating block matrices), (2) better printing of large matrices via the generic ``pretty'' print function, and (3) a number of convenience functions for users more familiar with other scientific languages like 'Julia', 'Matlab'/Octave', or 'Python'+NumPy'.

Suggests knitr, rmarkdown, testthat (>= 3.0.0)

License GPL (>= 2)

--------------	-----------

argmax	<i>Row/Column Max/Min Indices</i>
--------	-----------------------------------

Description

Returns the indices of the maximum or minimum values along an axis.

Usage

```
argmax(x, rows = TRUE)
```

```
argmin(x, rows = TRUE)
```

Arguments

x	A matrix .
rows	If TRUE (the default) the indices of each row max/min is returned.

Value

A vector of indices.

Examples

```
m <- mat("94, 20, 44; 40, 92, 51; 27, 69, 74")
argmax(m)
argmin(m)
```

atleast_2d

View Input as an Array with at Least Two Dimensions.

Description

Ensure that the input has at least two dimensions.

Usage

```
atleast_2d(x)
```

Arguments

x An appropriate R object supported by `dim()`, for example a [vector](#), [matrix](#), [array](#), or [data.frame](#).

Value

The same object, but with a "dim" attribute.

Examples

```
x <- 1:10
x
atleast_2d(x)
```

bmat*Block Matrices*

Description

Construct a block matrix using a character string initializer.

Usage

```
bmat(x, rows = TRUE, sep = ", ", ...)
```

Arguments

<code>x</code>	A data vector, character string, or a list.
<code>rows</code>	Logical. If TRUE (the default) the matrix is filled by rows, otherwise the matrix is filled by columns.
<code>sep</code>	Separator string. Values within each row/column of <code>x</code> are separated by this string. Default is <code>" "</code> .
<code>...</code>	Additional optional arguments.

Value

A [matrix](#).

See Also

[mat\(\)](#), [\[dmat\(\)\]](#).

Examples

```
# Construct a block matrix from matrices A1, A2, and A3
A1 <- mat("1, 1; 1, 1")
A2 <- mat("2, 2; 2, 2")
A3 <- mat("3, 3, 3, 3")
bmat("A1, A2; A3")
```

`clip`*Clip Values*

Description

Clip (i.e., limit) the values in a vector, matrix, or array.

Usage

```
clip(x, .min, .max, ...)
```

```
## Default S3 method:
```

```
clip(x, .min, .max, ...)
```

Arguments

<code>x</code>	A vector , matrix , or multi-way array .
<code>.min</code>	Minimum value.
<code>.max</code>	Maximum value.
<code>...</code>	Additional optional arguments.

Value

Returns `x` with values outside the interval `[.min, .max]` clipped to the interval edges. That is, values in `x` smaller than `.min` become `.min`, and values larger than `.max` become `.max`.

Examples

```
clip(1:10, 3, 8) # [1] 3 3 3 4 5 6 7 8 8 8  
clip(randn(5, 5), .min = -1, .max = 1)
```

`dmat`*Data Frames*

Description

Like `mat`, but returns a data frame.

Usage

```
dmat(x, ...)
```

Arguments

<code>x</code>	A data vector, character string, or a list .
<code>...</code>	Additional optional arguments passed on to mat .

Value

A [data.frame](#).

See Also

[mat](#), [bmat](#).

Examples

```
dmat("1e-01, 2+5, 3, 4, 5; 6, 7, 8, 9^2, pi", rows = FALSE)
z <- list(a = 1:10, b = 11:20, c = 21:30)
dmat(z) # list elements form rows
dmat(z, rows = FALSE) # list elements form columns
```

eye

Identity Matrix

Description

Creates an nrow-by-ncol identity matrix.

Usage

```
eye(nrow = 1, ncol = nrow)
```

Arguments

nrow	The desired number of rows.
ncol	The desired number of columns.

Value

A nrow-by-ncol identity [matrix](#).

See Also

[diag](#).

Examples

```
eye(4) # 4-by-4 identity matrix
eye(4, 4) # 4-by-4 identity matrix
eye(3, 5) # 3-by-5 identity matrix
eye(5, 3) # 5-by-3 identity matrix
```

fill	<i>Fill a Matrix</i>
------	----------------------

Description

Create a matrix filled with the value `x`.

Usage

```
fill(x, nrow = 1, ncol = 1, ..., atleast_2d = NULL)
```

```
falses(nrow = 1, ncol = 1, ..., atleast_2d = NULL)
```

```
trues(nrow = 1, ncol = 1, ..., atleast_2d = NULL)
```

```
ones(nrow = 1, ncol = 1, ..., atleast_2d = NULL)
```

```
zeros(nrow = 1, ncol = 1, ..., atleast_2d = NULL)
```

Arguments

<code>x</code>	The (single) value to fill the matrix with.
<code>nrow</code>	The desired number of rows.
<code>ncol</code>	The desired number of columns.
<code>...</code>	Further dimensions of the array.
<code>atleast_2d</code>	Logical indicating whether or not to force column vectors to have a second dimension equal to one. Defaults to FALSE. This behavior can also be changed globally using, for example <code>options(atleast_2d = TRUE)</code> .

Value

A [matrix](#) or [array](#) filled with the value `x`.

See Also

[ones](#), [zeros](#), [falses](#), [trues](#), [mat](#), and [matrix](#)

Examples

```
fill(pi, 3, 5) # 3-by-5 matrix filled with the value of pi
fill(pi, 3, 5, 2, 2) # 3-by-5-by-2-by-2 array filled with the value of pi
pi * ones(3, 5)
zeros(10)
zeros(10, atleast_2d = TRUE)
```

flatten	<i>Flatten Matrices/Arrays</i>
---------	--------------------------------

Description

Flatten (i.e., collapse) a matrix or array to one dimension.

Usage

```
flatten(x, across = c("rows", "columns"))
```

Arguments

x	A matrix .
across	Character string specifying whether to flatten the matrix across "rows" (default) or "columns". This option is ignored for multi-way arrays.

Value

A numeric vector.

See Also

[mat](#).

Examples

```
m <- mat("2, 4, 6, 8; 10, 12, 14, 16")
flatten(m)
flatten(m, across = "columns")
```

hcat	<i>Concatenate Matrices</i>
------	-----------------------------

Description

Concatenate matrices along the first or second dimension.

Usage

```
hcat(...)
```

```
vcat(...)
```

Arguments

...	Vectors or matrices.
-----	----------------------

Value

A [matrix](#) formed by combining the ... arguments column-wise ([hcat](#)) or row-wise ([vcat](#)).

See Also

[bmat\(\)](#), [cbind\(\)](#), [rbind\(\)](#).

Examples

```
m1 <- mat("1, 2, 3; 4, 5, 6")
m2 <- mat("7, 8, 9; 10, 11, 12")
hcat(m1, m2) # same as 'bmat("m1, m2")'
vcat(m1, m2) # same as 'bmat("m1; m2")'
```

inv

Matrix Inverse

Description

Calculates the inverse of a square matrix.

Usage

```
inv(x, ...)
```

Arguments

x	A square numeric or complex matrix .
...	Additional optional arguments.

Details

See [solve](#) for details.

See Also

[solve](#).

Examples

```
m <- 3 * eye(5)
inv(m)
```

`is.tril`*Lower Triangular Matrix Test*

Description

Determine if a matrix is lower triangular.

Usage

```
is.tril(x)
```

Arguments

`x` A [matrix](#).

Value

Logical indicating whether the given matrix is lower triangular.

Examples

```
m <- mat("1, 0, 0, 0; -1, 1, 0, 0; -2, -2, 1, 0; -3, -3, -3, 1")
is.tril(m)
is.tril(eye(3, 5))
```

`is.triu`*Upper Triangular Matrix Test*

Description

Determine if a matrix is upper triangular.

Usage

```
is.triu(x)
```

Arguments

`x` A [matrix](#).

Value

Logical indicating whether the given matrix is lower triangular.

Examples

```
m <- mat("1, -1, -1, -1; 0, 1, -2, -2; 0, 0, 1, -3; 0, 0, 0, 1")
is.triu(m)
is.triu(eye(3, 5))
```

linspace	<i>Linearly-spaced Elements</i>
----------	---------------------------------

Description

Construct a vector of n linearly-spaced elements from a to b .

Usage

```
linspace(a, b, n = 50)
```

Arguments

a	The starting value of the sequence.
b	The final value of the sequence.
n	The number of samples to generate. Default is 50.

Value

A vector of linearly-spaced elements.

See Also

[logspace\(\)](#), [seq\(\)](#).

Examples

```
linspace(0, 1)
linspace(1, 5, 5)
linspace(1 + 2i, 10 + 10i, 8)
logspace(0, pi, 10)
```

logspace	<i>Logarithmically-spaced Elements</i>
----------	----------------------------------------

Description

Construct a vector of n logarithmically-spaced elements from 10^a to 10^b .

Usage

```
logspace(a, b, n = 50, base = 10)
```

Arguments

a	base ^a is the starting value of the sequence.
b	base ^b is the final value of the sequence.
n	The number of samples to generate. Default is 50.
base	The base of the log space.

Value

A vector of logarithmically-spaced elements.

Note

If $b = \pi$ and $\text{base} = 10$, the points are between 10^a and π , not 10^a and 10^π , for compatibility with the corresponding MATLAB/Octave, and NumPy functions.

See Also

[linspace\(\)](#), [seq\(\)](#).

mat

Matrices

Description

Like [matrix](#), this function creates a matrix from the given set of values. However, these values can also be represented by a character string, or a [list](#) of vectors. Initially inspired by [NumPy's matrix function](#).

Usage

```
mat(x, ...)  
  
## Default S3 method:  
mat(x, ...)  
  
## S3 method for class 'character'  
mat(x, rows = TRUE, sep = ",", eval = FALSE, ...)  
  
## S3 method for class 'list'  
mat(x, rows = TRUE, ...)
```

Arguments

x	A data vector, character string, or a list.
...	Additional optional arguments to be passed on to matrix .
rows	Logical. If TRUE (the default) the matrix is filled by rows, otherwise the matrix is filled by columns.
sep	Separator string. Values within each row/column of x are separated by this string. Default is ", ".
eval	Logical indicating whether or not the character string contains R expressions that need to be evaluated. Default is FALSE. See examples below for usage.

Value

A [matrix](#).

See Also

[bmat\(\)](#), [dmat\(\)](#), [matrix\(\)](#).

Examples

```
# Creating a matrix from a character string
mat("1, 2, 3, 4; 5, 6, 7, 8") # ";" separates rows
mat("1, 2, 3, 4; 5, 6, 7, 8", rows = FALSE) # ";" separates columns
mat("1 2 3 4; 5 6 7 8", sep = " ") # use spaces instead of commas
mat(c(1, 2, 3, 4, 5, 6, 7, 8), nrow = 2, byrow = TRUE) # works like matrix too

# Character strings containing R expressions
mat("rnorm(3); rnorm(3)")
mat("rnorm(3); rnorm(3)", eval = TRUE)
mat("1, 2, 3; 4, 5, pi")
mat("1, 2, 3; 4, 5, pi", eval = TRUE)
mat("-1, -.1; -0.1, -1.0")

# Creating a matrix from a list
z1 <- list(1:5, 6:10)
z2 <- list(a = 1:5, b = 6:10)
mat(z1)
mat(z2) # preserves names as row names
mat(z2, rows = FALSE) # preserves names as column names
```

matrix_rank

Matrix Rank

Description

Compute the rank of a matrix using the singular value decomposition (SVD) method.

Usage

```
matrix_rank(x, tol)

## Default S3 method:
matrix_rank(x, tol)

## S3 method for class 'matrix'
matrix_rank(x, tol)

## S3 method for class 'data.frame'
matrix_rank(x, tol)
```

Arguments

x A [matrix](#).

tol Threshold below which SVD values are considered zero.

Details

The singular value decomposition (SVD) method simply computes the SVD of x and returns the number of singular values of x that are greater than tol. See [Matrix::rankMatrix\(\)](#) for alternative methods.

Examples

```
matrix_rank(1:5)
matrix_rank(randn(2, 2))
matrix_rank(cbind(c(1, 1, 1), c(2, 2, 2)))
matrix_rank(ones(3, 3))
matrix_rank(zeros(3, 5))
```

 meshgrid

Rectangular 2-D Grid

Description

Creates matrices for vectorized evaluations of 2-D scalar/vector fields over 2-D grids.

Usage

```
meshgrid(x, y = x)
```

Arguments

x Numeric vector representing the first coordinate of the grid.

y Numeric vector representing the second coordinate of the grid.

Value

A list of matrices.

See Also

[expand.grid\(\)](#), [outer\(\)](#).

Examples

```
mg <- meshgrid(linspace(-4 * pi, 4 * pi, 27)) # list of input matrices
z <- cos(mg[[1]]^2 + mg[[2]]^2) * exp(-sqrt(mg[[1]]^2 + mg[[2]]^2) / 6)
image(z, axes = FALSE) # color image
contour(z, add = TRUE, drawlabels = FALSE) # add contour lines
```

pprint

*Pretty Printing***Description**

Prettier printing for matrices and data frames.

Usage

```
pprint(x, ...)

## S3 method for class 'matrix'
pprint(x, rowdots = NULL, coldots = NULL, digits = NULL, ...)

## S3 method for class 'data.frame'
pprint(x, rowdots = NULL, coldots = NULL, digits = NULL, ...)
```

Arguments

x	A matrix or data.frame .
...	Additional optional arguments. None are used at present.
rowdots	Integer specifying the row to replace with ... notation. Default is 4.
coldots	Integer specifying the column to replace with ... notation. Default is 4.
digits	The minimum number of significant digits to be printed in values.

Details

For a [matrix](#) or [data.frame](#) (which are coerced to a matrix via [data.matrix](#), `pprint()` will replace all the rows starting from `rowdots` up to and including the second-to-last row with a single row filled with ...s. The same is applied to the columns as well. Hence a large [matrix](#) (or [data.frame](#)) will be printed in a much more compact form.

Examples

```
pprint(randn(100, 100))
pprint(resize(1:100, 10, 10))
```

 rand

Matrix/Array of Uniform Random Numbers

Description

Construct a matrix or multi-way array of uniform random deviates.

Usage

```
rand(nrow = 1, ncol = 1, ..., min = 0, max = 1, atleast_2d = NULL)
```

Arguments

nrow	The desired number of rows.
ncol	The desired number of columns.
...	Further dimensions of the array.
min	Lower limit for the uniform distribution. Must be finite. (rand only).
max	Upper limit for the uniform distribution. Must be finite. (rand only).
atleast_2d	Logical indicating whether or not to force column vectors to have a second dimension equal to one. Defaults to FALSE. This behavior can also be changed globally using, for example <code>options(atleast_2d = TRUE)</code> .

Value

A matrix or array of pseudorandom numbers.

A [matrix](#) or [array](#) of pseudorandom numbers.

See Also

[randi\(\)](#), [randn\(\)](#), [runif\(\)](#)

[randi\(\)](#), [randn\(\)](#), [runif\(\)](#).

Examples

```
rand(100, 100) # 100 by 100 matrix of uniform random numbers
rand(2, 3, min = 100, max = 200)
```

randi	<i>Matrix/Array of Uniform Random Integers</i>
-------	------------------------------------------------

Description

Construct a matrix or multi-way array of uniform random integers.

Usage

```
randi(imax, nrow, ncol = 1, ..., atleast_2d = NULL)
```

Arguments

imax	A positive integer.
nrow	The desired number of rows.
ncol	The desired number of columns.
...	Further dimensions of the array.
atleast_2d	Logical indicating whether or not to force column vectors to have a second dimension equal to one. Defaults to FALSE. This behavior can also be changed globally using, for example <code>options(atleast_2d = TRUE)</code> .

Value

A [matrix](#) or [array](#) of pseudorandom numbers.

See Also

[rand\(\)](#), [randn\(\)](#), [sample\(\)](#).

Examples

```
randi(2, 5, 5)
```

randn	<i>Matrix/Array of Normal Random Numbers</i>
-------	----------------------------------------------

Description

Construct a matrix or multi-way array of normal random deviates.

Usage

```
randn(nrow = 1, ncol = 1, ..., mean = 0, sd = 1, atleast_2d = NULL)
```

Arguments

nrow	The desired number of rows.
ncol	The desired number of columns.
...	Further dimensions of the array.
mean	Mean for the normal distribution. (randn only).
sd	Standard deviation for the normal distribution. (randn only).
atleast_2d	Logical indicating whether or not to force column vectors to have a second dimension equal to one. Defaults to FALSE. This behavior can also be changed globally using, for example <code>options(atleast_2d = TRUE)</code> .

Value

A [matrix](#) or [array](#) of pseudorandom numbers.

See Also

[rand\(\)](#), [randi\(\)](#), [rnorm\(\)](#).

Examples

```
randn(100, 100) # 100 by 100 matrix of standard normal random variates
randn(2, 3, mean = 10, sd = 0.1)
```

repmat

Repeat Vectors and Matrices

Description

Repeat a vector or matrix a specific number of times.

Usage

```
repmat(x, m, n)
```

Arguments

x	A vector or matrix .
m	Integer specifying how many times to repeat x in the first dimension.
n	Integer specifying how many times to repeat x in the second dimension.

Value

A block matrix of dimension $m \times \text{nrow}(x)$ by $n \times \text{ncol}(x)$.

Examples

```
repmat(1:3, 3, 2) # will have dimension 9 by 2
repmat(randn(2, 2), 3, 2)
```

resize	<i>Resize Matrices and Arrays</i>
--------	-----------------------------------

Description

Change shape and size of a matrix or array.

Usage

```
resize(x, nrow, ncol, ..., across = c("rows", "columns"), byrow = FALSE)
```

Arguments

x	A matrix or multi-way array .
nrow	The desired number of rows.
ncol	The desired number of columns.
...	Further dimensions of the array.
across	Character string specifying whether to flatten the matrix across "rows" (default) or "columns". This option is ignored for multi-way arrays.
byrow	Logical. If FALSE (default) the new matrix is filled by columns, otherwise it is filled by rows. This option is ignored for multi-way arrays.

Value

A [matrix](#) with dimension nrow-by-ncol.

See Also

[flatten\(\)](#), [mat\(\)](#), [matrix\(\)](#).

Examples

```
m <- 1:9
resize(m)
resize(m, 3, 3)
resize(m, 2, 2)
```

size	<i>Dimensions of a Matrix/Array</i>
------	-------------------------------------

Description

Retrieve the dimensions of a matrix or array.

Usage

```
size(x)
```

Arguments

x A [matrix](#), [array](#), or [data.frame](#).

Value

The dimensions of the object.

See Also

[dim](#).

Examples

```
m <- mat("1, 3, 5; 7, 9, 11")
size(m)
```

tr	<i>Trace of a Matrix</i>
----	--------------------------

Description

Sum of diagonal elements of a matrix.

Usage

```
tr(x)
```

Arguments

x A [matrix](#).

Value

The sum of the diagonal elements of x.

Examples

```
tr(ones(5, 10))
x <- replicate(1000, tr(rand(25, 25)))
hist(x)
```

tri *Lower/Upper Triangular Matrix*

Description

Construct a matrix with ones at and below the given diagonal and zeros elsewhere.

Usage

```
tri(nrow, ncol = nrow, k = 0, diag = TRUE)
```

Arguments

nrow	The desired number of rows.
ncol	The desired number of columns.
k	The sub-diagonal at and below which the matrix is filled. $k = 0$ is the main diagonal, while $k < 0$ is below it, and $k > 0$ is above. The default is 0.
diag	Logical indicating whether to include the diagonal. Default is TRUE.

Examples

```
tri(5, 5)
tri(5, 5, 2)
tri(5, 5, -1)
```

tril *Extract Lower Triangular Matrix*

Description

Extract the lower triangular part of a matrix.

Usage

```
tril(x, k = 0, diag = TRUE)
```

Arguments

x	A matrix .
k	The sub-diagonal at and below which the matrix is filled. $k = 0$ is the main diagonal, while $k < 0$ is below it, and $k > 0$ is above. The default is 0.
diag	Logical indicating whether to include the diagonal. Default is TRUE.

Examples

```
tril(ones(5, 5))
tril(ones(5, 5), diag = TRUE)
```

triu	<i>Extract Upper Triangular Matrix</i>
------	----------------------------------------

Description

Extract the upper triangular part of a matrix.

Usage

```
triu(x, k = 0, diag = TRUE)
```

Arguments

x	A matrix .
k	The sub-diagonal at and below which the matrix is filled. $k = 0$ is the main diagonal, while $k < 0$ is below it, and $k > 0$ is above. The default is 0.
diag	Logical indicating whether to include the diagonal. Default is TRUE.

Examples

```
triu(ones(5, 5))
triu(ones(5, 5), diag = FALSE)
```
