

# Package ‘wakefield’

July 22, 2025

**Title** Generate Random Data Sets

**Version** 0.3.6

**Maintainer** Tyler Rinker <tyler.rinker@gmail.com>

**Description** Generates random data sets including: data.frames, lists, and vectors.

**Depends** R (>= 3.2.0)

**Imports** chron, ggplot2, dplyr, stringi

**Suggests** testthat

**License** GPL-2

**LazyData** TRUE

**URL** <https://github.com/trinker/wakefield>

**BugReports** <https://github.com/trinker/wakefield/issues>

age	<i>Generate Random Vector of Ages</i>
-----	---------------------------------------

---

## Description

Generate a random vector of ages within the provided range. The default age range is set between 18 and 89, to match the age ranges which appear (see e.g., <https://gssdataexplorer.norc.org/variables/53/vshow>).

## Usage

```
age(n, x = 18:89, prob = NULL, name = "Age")
```

## Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

## Value

Returns a random integer vector of ages within the provided range (defaults to 18:89).

## See Also

Other variable functions: `animal()`, `answer()`, `area()`, `car()`, `children()`, `coin()`, `color`, `date_stamp()`, `death()`, `dice()`, `dna()`, `dob()`, `dummy()`, `education()`, `employment()`, `eye()`, `grade_level()`, `grade()`, `group()`, `hair()`, `height()`, `income()`, `internet_browser()`, `iq()`, `language`, `level()`, `likert()`, `lorem_ipsum()`, `marital()`, `military()`, `month()`, `name`, `normal()`, `political()`, `race()`, `religion()`, `sat()`, `sentence()`, `sex_inclusive()`, `sex()`, `smokes()`, `speed()`, `state()`, `string()`, `upper()`, `valid()`, `year()`, `zip_code()`

## Examples

```
age(10) # draw 10 ages with default values
hist(age(n=10000))
interval(age, 3, n = 1000)
```

---

`animal`*Generate Random Vector of animals*

---

**Description**

`animal` - Generate a random vector of animals.

`pet` - Generate a random vector of pets.

**Usage**

```
animal(n, k = 10, x = wakefield::animal_list, prob = NULL, name = "Animal")

pet(
  n,
  x = c("Dog", "Cat", "None", "Bird", "Horse"),
  prob = c(0.365, 0.304, 0.258, 0.031, 0.015),
  name = "Pet"
)
```

**Arguments**

<code>n</code>	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
<code>k</code>	The number of the elements of <code>x</code> to sample from (uses <code>sample(x, k)</code> ).
<code>x</code>	A vector of elements to chose from.
<code>prob</code>	A vector of probabilities to chose from.
<code>name</code>	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

The household pets and probabilities:

Dog	36.5 %
Cat	30.4 %
None	25.8 %
Bird	3.1 %
Horse	1.5 %

**Value**

Returns a random factor vector of animal elements.

**See Also**

Other variable functions: `age()`, `answer()`, `area()`, `car()`, `children()`, `coin()`, `color`, `date_stamp()`, `death()`, `dice()`, `dna()`, `dob()`, `dummy()`, `education()`, `employment()`, `eye()`, `grade_level()`, `grade()`, `group()`, `hair()`, `height()`, `income()`, `internet_browser()`, `iq()`, `language`, `level()`, `likert()`, `lorem_ipsum()`, `marital()`, `military()`, `month()`, `name`, `normal()`, `political()`, `race()`, `religion()`, `sat()`, `sentence()`, `sex_inclusive()`, `sex()`, `smokes()`, `speed()`, `state()`, `string()`, `upper()`, `valid()`, `year()`, `zip_code()`

**Examples**

```
animal(10)
pie(table(animal(10000)))

pet(10)
pie(table(pet(10000)))
```

---

animal\_list

*Animal List*

---

**Description**

A dataset containing a character vector animals

**Usage**

```
data(animal_list)
```

**Format**

A character vector with 591 elements

**References**

<https://a-z-animals.com/animals>

---

answer

*Generate Random Vector of Answers (Yes/No)*

---

**Description**

Generate a random vector of answers (yes/no).

**Usage**

```
answer(n, x = c("No", "Yes"), prob = NULL, name = "Answer")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of answers to sample from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random factor vector of answers (yes/no) outcome elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
answer(10)
100*table(answer(n <- 10000))/n
```

---

area	<i>Generate Random Vector of Areas</i>
------	--

---

**Description**

Generate a random vector of areas ("Suburban", "Urban", "Rural").

**Usage**

```
area(n, x = c("Suburban", "Urban", "Rural"), prob = NULL, name = "Area")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of area status elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
area(10)
barplot(table(area(10000)))
```

---

as\_integer

*Convert a Factor Data Frame to Integer*

---

**Description**

Converts a [data.frame](#) of [factors](#) to integers.

**Usage**

```
as_integer(x, cols = NULL, fun = as.integer)
```

**Arguments**

x	A <a href="#">data.frame</a> of <a href="#">factors</a> .
cols	Numeric indices of the columns to include (use - to exclude as well). Default is to assign random NAs to all columns except the first column.
fun	An <a href="#">as.</a> coercion function to apply to each column. Default is <a href="#">as.integer</a> .

**Value**

Returns a [data.frame](#) equal to the [class](#) of x with integer columns rather than factor.

**See Also**

[r\\_series](#)

**Examples**

```

as_integer(r_series(likert_7, 5, 10))
as_integer(r_series(likert_7, 5, 10), cols = c(2, 4))

library(dplyr)
r_data_frame(n=100,
  age,
  political,
  sex,
  grade
) %>%
  as_integer(2:3)

```

---

car *Generate Random Vector of Cars*

---

**Description**

Generate a random vector of cars (see [?mtcars](#)).

**Usage**

```
car(n, x = rownames(datasets::mtcars), prob = NULL, name = "Car")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of car elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

## Examples

```
car(10)
table(car(10000))
```

---

children	<i>Generate Random Vector of Number of Children</i>
----------	---

---

## Description

Generate a random vector of number of children.

## Usage

```
children(
  n,
  x = 0:10,
  prob = c(0.25, 0.25, 0.15, 0.15, 0.1, 0.02, 0.02, 0.02, 0.02, 0.01, 0.01),
  name = "Children"
)
```

## Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

## Value

Returns a random vector of number of children elements.

## See Also

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

## Examples

```
children(10)
pie(table(children(100)))
```

---

coin	<i>Generate Random Vector of Coin Flips</i>
------	---

---

### Description

Generate a random vector of coin flips (heads/tails).

### Usage

```
coin(n, x = c("Tails", "Heads"), prob = NULL, name = "Coin")
```

### Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of coin outcomes to sample from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

### Value

Returns a random factor vector of coin flip outcome elements.

### See Also

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

### Examples

```
coin(10)
100*table(coin(n <- 10000))/n
```

---

color *Generate Random Vector of Colors*

---

### Description

color - Generate a random vector of colors (sampled from colors()).

color - Generate a random vector of *psychological primary* colors (sampled from colors()).

### Usage

```
color(n, k = 10, x = grDevices::colors(), prob = NULL, name = "Color")
```

```
primary(
  n,
  x = c("Red", "Green", "Blue", "Yellow", "Black", "White"),
  prob = NULL,
  name = "Color"
)
```

### Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
k	The number of the elements of <code>x</code> to sample from (uses <code>sample(x, k)</code> ).
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

### Value

Returns a random factor vector of color elements.

### See Also

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language\\_level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name\\_normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```

color(10)
pie(tab <- table(color(10000)), col = names(tab))

primary(10)
pie(tab <- table(primary(10000)), col = names(tab))
barplot(tab <- table(primary(10000, prob = probs(6))), col = names(tab))

```

---

date\_stamp

*Generate Random Vector of Dates*

---

**Description**

Generate a random vector of dates.

**Usage**

```

date_stamp(
  n,
  random = FALSE,
  x = NULL,
  start = Sys.Date(),
  k = 12,
  by = "-1 months",
  prob = NULL,
  name = "Date"
)

```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
random	logical. If TRUE the dates are randomized, otherwise the dates are sequential.
x	A vector of elements to chose from. This may be NULL if arguments are supplied to <code>start</code> , <code>k</code> , and <code>by</code> . The <code>x</code> argument takes precedence over the other three if <code>!is.null</code> . Note that <code>start</code> , <code>k</code> , and <code>by</code> work together to make a vector of dates to sample from. See <a href="#">seq.Date</a> for additional information.
start	A date to start the sequence at.
k	The length of the sequence (number of the elements) so build out from <code>start</code> .
by	The interval to use in building the sequence.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random factor vector of date elements.

**See Also**

[seq.Date](#)

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
date_stamp(10)
pie(table(date_stamp(2000, prob = probs(12))))

## Supply dates to `x` to sample from
date_stamp(10, x = seq(as.Date("1980-11-16"), length = 30, by = "1 years"))
```

---

death

*Generate Random Vector of Deaths Outcomes*

---

**Description**

Generate a random logical vector of deaths (TRUE/FALSE).

**Usage**

```
death(n, prob = NULL, name = "Death")

died(n, prob = NULL, name = "Died")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random logical vector of death outcome elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
death(10)
died(10)
100*table(death(n <- 10000))/n
100*table(death(n <- 10000, prob = c(.3, .7)))/n
r_data_frame(10, died)
```

---

dice	<i>Generate Random Vector of Dice Throws</i>
------	--

---

**Description**

Generate a random vector of dice throws.

**Usage**

```
dice(n, x = 1:6, prob = NULL, name = "Dice")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of dice throw elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
dice(10)
barplot(table(dice(10000)))
```

dna

*Generate Random Vector of DNA Nucleobases***Description**

Generate a random vector of DNA nucleobases ("Guanine", "Adenine", "Thymine", "Cytosine").

**Usage**

```
dna(
  n,
  x = c("Guanine", "Adenine", "Thymine", "Cytosine"),
  prob = NULL,
  name = "DNA"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of DNA nucleobase elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
dna(10)
barplot(table(dna(10000)))
```

---

`dob`*Generate Random Vector of Birth Dates*

---

### Description

Generate a random vector of birth dates.

### Usage

```
dob(  
  n,  
  random = TRUE,  
  x = NULL,  
  start = Sys.Date() - 365 * 15,  
  k = 365 * 2,  
  by = "1 days",  
  prob = NULL,  
  name = "DOB"  
)  
  
birth(  
  n,  
  random = TRUE,  
  x = NULL,  
  start = Sys.Date() - 365 * 15,  
  k = 365 * 2,  
  by = "1 days",  
  prob = NULL,  
  name = "Birth"  
)
```

### Arguments

<code>n</code>	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
<code>random</code>	logical. If TRUE the dates are randomized, otherwise the dates are sequential.
<code>x</code>	A vector of elements to chose from. This may be NULL if arguments are supplied to <code>start</code> , <code>k</code> , and <code>by</code> . The <code>x</code> argument takes precedence over the other three if <code>!is.null</code> . Note that <code>start</code> , <code>k</code> , and <code>by</code> work together to make a vector of dates to sample from. See <a href="#">seq.Date</a> for additional information.
<code>start</code>	A date to start the sequence at.
<code>k</code>	The length of the sequence (number of the elements) so build out from <code>start</code> .
<code>by</code>	The interval to use in building the sequence.
<code>prob</code>	A vector of probabilities to chose from.

**name**                    The name to assign to the output vector's varname attribute. This is used to auto assign names to the column/vector name when used inside of `r_data_frame` or `r_list`.

### Value

Returns a random vector of birth date elements.

### See Also

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

### Examples

```
dob(10)
barplot(table(birth(15)))
barplot(table(birth(30)))
```

---

dummy

*Generate Random Dummy Coded Vector*

---

### Description

Generate a random dummy coded (0/1) vector.

### Usage

```
dummy(n, prob = NULL, name = "Dummy")
```

### Arguments

**n**                    The number elements to generate. This can be globally set within the environment of `r_data_frame` or `r_list`.

**prob**                A vector of probabilities to chose from.

**name**                The name to assign to the output vector's varname attribute. This is used to auto assign names to the column/vector name when used inside of `r_data_frame` or `r_list`.

### Value

Returns a random dummy vector of (0/1) elements.

**See Also**

[sample.int](#)

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
dummy(100, name = "Var")
table(dummy(1000))
```

---

education

*Generate Random Vector of Educational Attainment Level*

---

**Description**

Generate a random vector of educational attainment level.

**Usage**

```
education(
  n,
  x = c("No Schooling Completed", "Nursery School to 8th Grade",
        "9th Grade to 12th Grade, No Diploma", "Regular High School Diploma",
        "GED or Alternative Credential", "Some College, Less than 1 Year",
        "Some College, 1 or More Years, No Degree", "Associate's Degree",
        "Bachelor's Degree", "Master's Degree", "Professional School Degree",
        "Doctorate Degree"),
  prob = c(0.013, 0.05, 0.085, 0.246, 0.039, 0.064, 0.15, 0.075, 0.176, 0.072, 0.019,
           0.012),
  name = "Education"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

The educational attainments and probabilities used match approximate U.S. educational attainment make-up (<http://www.census.gov>):

<b>Highest Attainment</b>	<b>Percent</b>
No Schooling Completed	1.3 %
Nursery School to 8th Grade	5 %
9th Grade to 12th Grade, No Diploma	8.5 %
Regular High School Diploma	24.6 %
GED or Alternative Credential	3.9 %
Some College, Less than 1 Year	6.4 %
Some College, 1 or More Years, No Degree	15 %
Associate's Degree	7.5 %
Bachelor's Degree	17.6 %
Master's Degree	7.2 %
Professional School Degree	1.9 %
Doctorate Degree	1.2 %

**Value**

Returns a random vector of educational attainment level elements.

**Examples**

```
education(10)
pie(table(education(10000)))
```

---

employment

*Generate Random Vector of Employment Statuses*

---

**Description**

Generate a random vector of employment statuses.

**Usage**

```
employment(
  n,
  x = c("Full Time", "Part Time", "Unemployed", "Retired", "Student"),
  prob = c(0.6, 0.1, 0.1, 0.1, 0.1),
  name = "Employment"
)
```

**Arguments**

**n** The number elements to generate. This can be globally set within the environment of `r_data_frame` or `r_list`.

**x** A vector of elements to chose from.

**prob** A vector of probabilities to chose from.

**name** The name to assign to the output vector's `varname` attribute. This is used to auto assign names to the column/vector name when used inside of `r_data_frame` or `r_list`.

**Details**

The following arbitrary probabilities are used:

<b>Employment Status</b>	<b>Percent</b>
Full Time	60%
Part Time	10%
Unemployed	10%
Retired	10%
Student	10%

**Value**

Returns a random vector of employment status elements.

**Examples**

```
employment(10)
pie(table(employment(10000)))
barplot(table(employment(10000)))
```

---

eye

*Generate Random Vector of Eye Colors*

---

### Description

Generate a random vector of eye colors.

### Usage

```
eye(  
  n,  
  x = c("Brown", "Blue", "Green", "Hazel", "Gray"),  
  prob = c(0.44, 0.3, 0.13, 0.09, 0.04),  
  name = "Eye"  
)
```

### Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

### Details

The eye colors and probabilities:

Color	Percent
Brown	44 %
Blue	30 %
Green	13 %
Hazel	9 %
Gray	4 %

### Value

Returns a random vector of eye color elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
eye(10)
barplot(v <- table(eye(10000)), col = replace(names(v), 4, "yellowgreen"))
```

---

grade

*Generate Random Vector of Grades*

---

**Description**

grade - Generate a random normal vector of percent grades.

grade - Generate a random normal vector of letter grades.

grade - Generate a random normal vector of grade point averages (GPA; 0.0 - 4.0 scale).

**Usage**

```
grade(n, mean = 88, sd = 4, name = "Grade", digits = 1)
```

```
grade_letter(n, mean = 88, sd = 4, name = "Grade_Letter")
```

```
gpa(n, mean = 88, sd = 4, name = "GPA")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
mean	The mean value for the normal distribution to be drawn from.
sd	The standard deviation of the normal distribution to draw from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .
digits	Integer indicating the number of decimal places to be used. Negative values are allowed (see <a href="#">round</a> ).

## Details

The conversion between percent range, letter grade, and GPA is:

Percent	Letter	GPA
97-100	A+	4.00
93-96	A	4.00
90-92	A-	3.67
87-89	B+	3.33
83-86	B	3.00
80-82	B-	2.67
77-79	C+	2.33
73-76	C	2.00
70-72	C-	1.67
67-69	D+	1.33
63-66	D	1.00
60-62	D-	0.67
< 60	F	0.00

## Value

Returns a random normal vector of grade elements.

## See Also

## Examples

```
grade(10)
hist(grade(10000))
interval(grade, 5, n = 1000)

grade_letter(10)
barplot(table(grade_letter(10000)))

gpa(10)
hist(gpa(10000))
```

---

`grade_level`*Generate Random Vector of Grade Levels*

---

**Description**

Generate a random vector of grade levels.

**Usage**

```
grade_level(  
  n,  
  x = c("K", "1", "2", "3", "4", "5", "6", "7", "8", "9", "10", "11", "12"),  
  prob = NULL,  
  name = "Grade_Level"  
)
```

**Arguments**

<code>n</code>	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
<code>x</code>	A vector of elements to chose from.
<code>prob</code>	A vector of probabilities to chose from.
<code>name</code>	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of grade level elements.

**See Also**

**Examples**

```
grade_level(10)  
barplot(table(grade_level(10000)))
```

---

grady_augmented	<i>Augmented List of Grady Ward's English Words and Mark Kantrowitz's Names List</i>
-----------------	--

---

### Description

A dataset containing a vector of Grady Ward's English words augmented with **qdapDictionaries's** DICTIONARY, Mark Kantrowitz's names list, other proper nouns, and contractions.

### Usage

```
data(grady_augmented)
```

### Format

A character vector with 122806 elements

### Details

A dataset containing a vector of Grady Ward's English words augmented with proper nouns (U.S. States, Countries, Mark Kantrowitz's Names List, and months) and contractions. That dataset is augmented to increase the data set size.

### References

Moby Thesaurus List by Grady Ward <https://www.gutenberg.org>

group	<i>Generate Random Vector of Control/Treatment Groups</i>
-------	---

---

### Description

Generate a random vector of binary groups (e.g., control/treatment).

### Usage

```
group(n, x = c("Control", "Treatment"), prob = NULL, name = "Group")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of groups to sample from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>vname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random factor vector of group (control/treatment) elements.

**Note**

If you want > 2 groups see `'r_sample_factor'`.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
group(10)
100*table(group(n <- 10000))/n
100*table(group(n <- 10000, prob = c(.3, .7)))/n
```

---

hair

*Generate Random Vector of Hair Colors*

---

**Description**

Generate a random vector of hair colors.

**Usage**

```
hair(
  n,
  x = c("Brown", "Black", "Blonde", "Red"),
  prob = c(0.35, 0.28, 0.26, 0.11),
  name = "Hair"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

The hair colors and probabilities:

Color	Percent
Brown	35 %
Black	28 %
Blonde	26 %
Red	11 %

**Value**

Returns a random vector of hair color elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
hair(10)
v <- table(hair(10000))
lbs <- paste0(names(v), "\n", round(100*v/sum(v), 1), "%")
pie(v, col = replace(names(v), 3, "yellow"), labels = lbs)
```

---

height	<i>Generate Random Vector of Heights</i>
--------	--

---

**Description**

height and height\_in - Generate a random normal vector of heights in inches.

height\_cm - Generate a random normal vector of heights in centimeters.

**Usage**

```
height(  
  n,  
  mean = 69,  
  sd = 3.75,  
  min = 1,  
  max = NULL,  
  digits = 0,  
  name = "Height"  
)
```

```
height_in(  
  n,  
  mean = 69,  
  sd = 3.75,  
  min = 1,  
  max = NULL,  
  digits = 1,  
  name = "Height(in)"  
)
```

```
height_cm(  
  n,  
  mean = 175.26,  
  sd = 9.525,  
  min = 1,  
  max = NULL,  
  digits = 1,  
  name = "Height(cm)"  
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
mean	The mean value for the normal distribution to be drawn from.
sd	The standard deviation of the normal distribution to draw from.

min	A numeric lower boundary cutoff. Results less than this value will be replaced with min.
max	A numeric upper boundary cutoff. Results greater than this value will be replaced with max.
digits	Integer indicating the number of decimal places to be used. Negative values are allowed (see <a href="#">round</a> ).
name	The name to assign to the output vector's varname attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random normal vector of height elements.

**Note**

height rounds to nearest whole number. height\_in & height\_in round to the nearest tenths.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language\\_level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
height(10)
hist(height(10000))
interval(height, 5, n = 1000)
```

---

hour

*Generate a Random Sequence of H:M:S Times*

---

**Description**

Generate a random vector of H:M:S times.

**Usage**

```
hour(n, x = seq(0, 23.5, by = 0.5), prob = NULL, random = FALSE, name = "Hour")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
random	logical. If TRUE the times are randomized, otherwise the times are sequential.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of H:M:S time elements.

**See Also**

[times](#)

**Examples**

```
hour(20)
hour(20, random=TRUE)
```

---

id	<i>Identification Numbers</i>
----	-------------------------------

---

**Description**

`id` - Generate a sequential [character](#) vector of zero-padded identification numbers (IDs).

`id_factor` - Generate a sequential [factor](#) vector of zero-padded identification numbers (IDs).

**Usage**

```
id(n, random = FALSE, name = "ID")
```

```
id_factor(n, random = FALSE, name = "ID")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
random	logical. If TRUE the IDs are randomized, otherwise the IDs are sequential.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a (optionally random) vector of [character/factor](#) observations ID numbers.

**Warning**

`id` uses [sprintf](#) to generate the padded ID. Per [sprintf](#)'s documentation: "The format string is passed down the OS's `sprintf` function...The behaviour on inputs not documented here is 'undefined', which means it is allowed to differ by platform." See [sprintf](#) for details.

**Note**

`id` is faster than `id_factor`, as the later coerces the vector to a [factor](#).

**See Also**

[sprintf](#)

**Examples**

```
id(1000)
r_data_frame(n=21, id)
```

---

income

*Generate Random Gamma Vector of Incomes*

---

**Description**

Generate a random gamma vector of incomes.

**Usage**

```
income(n, digits = 2, name = "Income")
```

**Arguments**

<code>n</code>	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
<code>digits</code>	Integer indicating the number of decimal places to be used. Negative values are allowed (see <a href="#">round</a> ).
<code>name</code>	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

Incomes are generated using: `rgamma(n, 2) * 2000`.

**Value**

Returns a random gamma vector of income elements.

**See Also**

[gamma](#)

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language\\_level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
income(10)
hist(income(10000))
pie(table(cut(income(10000), 10)))
```

---

internet\_browser

*Generate Random Vector of Internet Browsers*

---

**Description**

Generate a random vector of Internet browser.

**Usage**

```
internet_browser(
  n,
  x = c("Chrome", "IE", "Firefox", "Safari", "Opera", "Android"),
  prob = c(0.5027, 0.175, 0.1689, 0.0994, 0.017, 0.0132),
  name = "Browser"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

The browser use and probabilities (from <https://gs.statcounter.com/>):

<b>Browser</b>	<b>Percent</b>
Chrome	50.27 %
IE	17.50 %
Firefox	16.89 %
Safari	9.94 %
Opera	1.70 %
Android	1.32 %

**Value**

Returns a random factor vector of Internet browser elements.

**References**

<https://gs.statcounter.com/>

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
internet_browser(20)
barplot(table(internet_browser(10000)))
pie(table(internet_browser(10000)))
```

---

interval

*Cut Numeric Into Factor*

---

**Description**

A wrapper for [cut](#) that cuts the vector and then adds the varname produced by the original function.

**Usage**

```
interval(  
  fun,  
  breaks,  
  ...,  
  labels = NULL,  
  include.lowest = FALSE,  
  right = TRUE,  
  dig.lab = 3,  
  ordered_result = FALSE,  
  n  
)
```

**Arguments**

fun	A vector producing function.
breaks	Either a numeric vector of two or more unique cut points or a single number (greater than or equal to 2) giving the number of intervals into which the vector produced from fun is to be cut.
labels	Labels for the levels of the resulting category. By default, labels are constructed using "(a,b]" interval notation. If labels = FALSE, simple integer codes are returned instead of a factor.
include.lowest	logical. If TRUE an 'x[i]' equal to the lowest (or highest, for right = FALSE) 'breaks' value should be included.
right	logical. If TRUE the intervals will be closed on the right (and open on the left).
dig.lab	An integer which is used when labels are not given. It determines the number of digits used in formatting the break numbers.
ordered_result	logical. If TRUE the result be an ordered factor.
n	The number elements to generate. This can be globally set within the environment of r_data_frame or r_list.
...	Other arguments passed to fun.

**Value**

Returns a [cut](#) factor vector.

**See Also**

[cut](#)

**Examples**

```
interval(normal, 4, n=100)  
attributes(interval(normal, 4, n=100))  
interval(age, 3, n = 1000)
```

---

iq *Generate Random Vector of Intelligence Quotients (IQs)*

---

### Description

Generate a random normal vector of intelligence quotients (IQs).

### Usage

```
iq(n, mean = 100, sd = 10, min = 0, max = NULL, digits = 0, name = "IQ")
```

### Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
mean	The mean value for the normal distribution to be drawn from.
sd	The standard deviation of the normal distribution to draw from.
min	A numeric lower boundary cutoff. Results less than this value will be replaced with min.
max	A numeric upper boundary cutoff. Results greater than this value will be replaced with max.
digits	Integer indicating the number of decimal places to be used. Negative values are allowed (see <a href="#">round</a> ).
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

### Value

Returns a random normal vector of IQ elements.

### See Also

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

### Examples

```
iq(10)
hist(iq(10000))
interval(iq, 5, n = 1000)
```

---

language	<i>Generate Random Vector of Languages</i>
----------	--

---

**Description**

Generate a random vector of languages from the [presidential\\_debates\\_2012](#).

**Usage**

```
language(
  n,
  x = wakefield::languages[["Language"]],
  prob = wakefield::languages[["Proportion"]],
  name = "Language"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random character vector of language elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
language(10)
pie(table(language(10000)))

lang <- wakefield::languages[sample(1:99, 6), ]
lang["prop"] <- lang[["N"]]/sum(lang[["N"]])
labs <- round(100 * lang[["prop"]], 1)
pie(lang[["prop"]], paste0(lang[["Language"]], "\n", labs, "%"))
```

---

 languages

*Languages of the World*

---

**Description**

A dataset containing native language use statistics taken from: [https://en.wikipedia.org/wiki/List\\_of\\_languages\\_by\\_number\\_of\\_native\\_speakers](https://en.wikipedia.org/wiki/List_of_languages_by_number_of_native_speakers)

**Usage**

```
data(languages)
```

**Format**

A data frame with 99 rows and 4 variables

**Details**

- Language. The language spoken.
- N. The number of speakers world-wide.
- Proportion. The proportion of speakers.
- Percent. The percentage of speakers.

**References**

[https://en.wikipedia.org/wiki/List\\_of\\_languages\\_by\\_number\\_of\\_native\\_speakers](https://en.wikipedia.org/wiki/List_of_languages_by_number_of_native_speakers)

---

 level

*Generate Random Vector of Levels*

---

**Description**

level - Generate a random vector of integer levels (1-4).

math - Generate a random vector of integer mathematics levels (1-4) similar to New York State grades 3-8 assessment results.

ela - Generate a random vector of integer English language arts (ELA) levels (1-4) similar to New York State grades 3-8 assessment results.

**Usage**

```
level(n, x = 1:4, prob = NULL, name = "Level")
```

```
math(n, x = 1:4, prob = c(0.29829, 0.33332, 0.22797, 0.14042), name = "Math")
```

```
ela(n, x = 1:4, prob = c(0.3161, 0.37257, 0.2233, 0.08803), name = "ELA")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

Distribution of levels (used in `prob`) were taken from New York State' s 2014 assessment report: <http://www.p12.nysed.gov/irs/>

Level	ELA	Math
1	31.6%	29.8%
2	37.3%	33.3%
3	22.3%	22.8%
4	8.8%	14.0%

**Value**

Returns a random vector of integer levels (1-4) elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
level(10)
barplot(table(level(10000, prob = probs(4))))
```

```
math(10)
barplot(table(math(10000)))
```

```
ela(10)
barplot(table(ela(10000)))
```

---

`likert`*Generate Random Vector of Likert-Type Responses*

---

**Description**

Generate a random vector of Likert-type responses.

**Usage**

```
likert(  
  n,  
  x = c("Strongly Agree", "Agree", "Neutral", "Disagree", "Strongly Disagree"),  
  prob = NULL,  
  name = "Likert"  
)  
  
likert_5(  
  n,  
  x = c("Strongly Agree", "Agree", "Neutral", "Disagree", "Strongly Disagree"),  
  prob = NULL,  
  name = "Likert"  
)  
  
likert_7(  
  n,  
  x = c("Strongly Agree", "Agree", "Somewhat Agree", "Neutral", "Somewhat Disagree",  
        "Disagree", "Strongly Disagree"),  
  prob = NULL,  
  name = "Likert"  
)
```

**Arguments**

<code>n</code>	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
<code>x</code>	A vector of elements to chose from.
<code>prob</code>	A vector of probabilities to chose from.
<code>name</code>	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of Likert-type response elements.

**Note**

likert & likert\_5 are identical outputs, sampling from a 5-point response scale. likert\_7 samples from a 7-point response scale.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
dice(10)
barplot(table(dice(10000)))
```

---

```
lorem_ipsum
```

```
Generate Random Lorem Ipsum Strings
```

---

**Description**

Generates (pseudo)random lorem ipsum text.

**Usage**

```
lorem_ipsum(n, ..., name = "Lorem_Ipsum")
paragraph(n, ..., name = "Paragraph")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
...	Other arguments passed to <a href="#">stri_rand_lipsum</a> .
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random character vector of string elements.

**Note**

`lorem_ipsum` and `paragraph` produce identical strings but will produce different vector/column names when used inside of `r_data_frame` or `r_list`.

**See Also**

[stri\\_rand\\_lipsum](#)

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
lorem_ipsum(10)
paragraph(10)

lorem_ipsum(10, start_lipsum = FALSE)
```

---

marital

*Generate Random Vector of Marital Statuses*

---

**Description**

Generate a random vector of marital statuses.

**Usage**

```
marital(
  n,
  x = c("Married", "Divorced", "Widowed", "Separated", "Never Married"),
  prob = NULL,
  name = "Marital"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of marital status elements.

**See Also**

Other variable functions: `age()`, `animal()`, `answer()`, `area()`, `car()`, `children()`, `coin()`, `color`, `date_stamp()`, `death()`, `dice()`, `dna()`, `dob()`, `dummy()`, `education()`, `employment()`, `eye()`, `grade_level()`, `grade()`, `group()`, `hair()`, `height()`, `income()`, `internet_browser()`, `iq()`, `language`, `level()`, `likert()`, `lorem_ipsum()`, `military()`, `month()`, `name`, `normal()`, `political()`, `race()`, `religion()`, `sat()`, `sentence()`, `sex_inclusive()`, `sex()`, `smokes()`, `speed()`, `state()`, `string()`, `upper()`, `valid()`, `year()`, `zip_code()`

**Examples**

```
marital(10)
barplot(table(marital(10000)))
```

---

military

*Generate Random Vector of Military Branches*

---

**Description**

Generate a random vector of military branches.

**Usage**

```
military(
  n,
  x = c("Army", "Air Force", "Navy", "Marine Corps", "Coast Guard"),
  prob = c(0.3785, 0.2334, 0.2218, 0.1366, 0.0296),
  name = "Military"
)
```

**Arguments**

<code>n</code>	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
<code>x</code>	A vector of elements to chose from.
<code>prob</code>	A vector of probabilities to chose from.
<code>name</code>	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

The military branches and probabilities used match approximate U.S. military make-up:

<b>Branch</b>	<b>N</b>	<b>Percent</b>
Army	541,291	37.9%
Air Force	333,772	23.3%

Navy	317,237	22.2%
Marine Corps	195,338	13.7%
Coast Guard	42,357	3.0%

**Value**

Returns a random factor vector of military branch elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
military(10)
barplot(table(military(10000)))
pie(table(military(10000)))
```

---

minute

*Generate a Random Sequence of Minutes in H:M:S Format*

---

**Description**

Generate a random vector of minutes in H:M:S format.

**Usage**

```
minute(
  n,
  x = seq(0, 59, by = 1)/60,
  prob = NULL,
  random = FALSE,
  name = "Minute"
)
```

**Arguments**

**n** The number elements to generate. This can be globally set within the environment of `r_data_frame` or `r_list`.

**x** A vector of elements to chose from.

**prob** A vector of probabilities to chose from.

random	logical. If TRUE the times are randomized, otherwise the times are sequential.
name	The name to assign to the output vector's varname attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of minute time elements in H:M:S format.

**See Also**

[times](#)

**Examples**

```
minute(20)
minute(20, random=TRUE)
pie(table(minute(2000, x = seq(0, 59, by = 10)/60, prob = probs(6))))
```

---

month

*Generate Random Vector of Months*

---

**Description**

Generate a random factor vector of months.

**Usage**

```
month(n, x = month.name, prob = NULL, name = "Month")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's varname attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random character vector of month elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
month(10)
pie(table(month(10000, prob = probs(12))))
```

---

name	<i>Generate Random Vector of Names</i>
------	--

---

**Description**

Generate a random vector of first names. This dataset includes all unique entries from the `babynames` package.

**Usage**

```
name(
  n,
  x = wakefield::name_neutral,
  prob = NULL,
  replace = FALSE,
  name = "Name"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
replace	logical. If TRUE sampling is done with replacement. Default is without replacement.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of name elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
name(10)
name(100)
name(1000, replace = TRUE)
```

---

name_neutral	<i>Gender Neutral Names</i>
--------------	-----------------------------

---

**Description**

A dataset containing a character vector gender neutral names according to the U.S. Census.

**Usage**

```
data(name_neutral)
```

**Format**

A character vector with 662 elements

**References**

<http://www.census.gov>

---

normal	<i>Generate Random Normal Vector</i>
--------	--------------------------------------

---

**Description**

normal - A wrapper for [rnorm](#) that generate a random normal vector.

normal\_round - A wrapper for [rnorm](#) that generate a rounded random normal vector.

## Usage

```
normal(n, mean = 0, sd = 1, min = NULL, max = NULL, name = "Normal")

normal_round(
  n,
  mean = 0,
  sd = 1,
  min = NULL,
  max = NULL,
  digits = 2,
  name = "Normal"
)
```

## Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
mean	The mean value for the normal distribution to be drawn from.
sd	The standard deviation of the normal distribution to draw from.
min	A numeric lower boundary cutoff. Results less than this value will be replaced with <code>min</code> .
max	A numeric upper boundary cutoff. Results greater than this value will be replaced with <code>max</code> .
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .
digits	Integer indicating the number of decimal places to be used. Negative values are allowed (see <a href="#">round</a> ).

## Value

Returns a random vector of elements.

## See Also

[rnorm](#)

[round](#)

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

## Examples

```
normal(100, name = "Var")
hist(normal(10000, 100, 10))
interval(normal, 9, n = 1000)
```

---

peek

*Data Frame Viewing*

---

## Description

Convenience function to view all the columns of the head of a truncated `data.frame`. `peek` invisibly returns `x`. This makes its use ideal in a **dplyr/magrittr** pipeline.

## Usage

```
peek(x, n = 10, width = 10, ...)
```

## Arguments

<code>x</code>	A <code>data.frame</code> object.
<code>n</code>	Number of rows to display.
<code>width</code>	The width of the columns to be displayed.
<code>...</code>	For internal use.

## Details

By default **dplyr** does not print all columns of a data frame (`tbl_df`). This makes inspection of data difficult at times, particularly with text string data. `peek` allows the user to see a truncated head for inspection purposes.

## Value

Prints a truncated head but invisibly returns `x`.

## See Also

[head](#)

## Examples

```
(dat1 <- r_data_frame(100, id, sentence, paragraph))
peek(dat1)
peek(dat1, n = 20)
peek(dat1, width = 40)

library(dplyr)
```

```
## Use in a dplyr/magrittr pipeline to view the data (silly example)
par(mfrow = c(2, 2))

r_data_frame(1000, id, sex, pet, employment, eye, sentence, paragraph) %>%
  peek %>%
  (function(x, ind = 2:5){ invisible(lapply(ind, function(i) pie(table(x[[i]]))))})

## A wider data set example
dat2 <- r_data_theme()

dat2
peek(dat2)
```

---

plot.tbl\_df                      *Plots a tbl\_df Object*

---

### Description

Plots a tbl\_df object.

### Usage

```
## S3 method for class 'tbl_df'
plot(x, ...)
```

### Arguments

x                      The tbl\_df object.  
 ...                    Arguments passed to [table\\_heat](#).

---

political                      *Generate Random Vector of Political Parties*

---

### Description

Generate a random vector of political parties.

### Usage

```
political(
  n,
  x = c("Democrat", "Republican", "Constitution", "Libertarian", "Green"),
  prob = c(0.577269133302094, 0.410800432748879, 0.00491084954793489,
    0.00372590303330866, 0.0032936813677832),
  name = "Political"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

The political parties and probabilities used match approximate U.S. political make-up of registered voters (2014). The default make up is:

Party	N	Percent
Democrat	43,140,758	57.73%
Republican	30,700,138	41.08%
Constitution	367,000	.49%
Libertarian	278,446	.37%
Green	246,145	.33%

**Value**

Returns a random factor vector of political party elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
political(10)
barplot(table(political(10000)))
```

---

presidential\_debates\_2012

*2012 U.S. Presidential Debate Dialogue*

---

**Description**

A dataset containing 2911 ordered sentences used by speakers during the three 2012 presidential debates.

**Usage**

```
data(presidential_debates_2012)
```

**Format**

A character vector with 2911 elements

---

`print.available`

*Prints an available Object.*

---

**Description**

Prints an available object.

**Usage**

```
## S3 method for class 'available'  
print(x, ...)
```

**Arguments**

`x`                    The available object

`...`                 ignored

---

print.variable	<i>Prints a variable Object</i>
----------------	---------------------------------

---

**Description**

Prints a variable object

**Usage**

```
## S3 method for class 'variable'  
print(x, ...)
```

**Arguments**

x	The variable object.
...	Ignored.

---

probs	<i>Generate a Random Vector of Probabilities.</i>
-------	---

---

**Description**

Generate a random vector of probabilities that sum to 1.

**Usage**

```
probs(j, upper = 1e+06)
```

**Arguments**

j	An integer of number of probability elements (typically performs best at $j < 4000$ ).
upper	probs works by sampling from $1 : upper$ j times and then dividing each sample by the sum of all samples.

**Value**

Returns a vector of probabilities summing to 1.

**Examples**

```
probs(10)  
sum(probs(100))  
pie(table(month(10000, prob = probs(12))))
```

---

race *Generate Random Vector of Races*

---

### Description

Generate a random vector of races.

### Usage

```
race(  
  n,  
  x = c("White", "Hispanic", "Black", "Asian", "Bi-Racial", "Native", "Other",  
        "Hawaiian"),  
  prob = c(0.637, 0.163, 0.122, 0.047, 0.019, 0.007, 0.002, 0.0015),  
  name = "Race"  
)
```

### Arguments

**n** The number elements to generate. This can be globally set within the environment of `r_data_frame` or `r_list`.

**x** A vector of elements to chose from.

**prob** A vector of probabilities to chose from.

**name** The name to assign to the output vector's `varname` attribute. This is used to auto assign names to the column/vector name when used inside of `r_data_frame` or `r_list`.

### Details

The races and probabilities used match approximate U.S. racial make-up. The default make up is:

<b>Race</b>	<b>Percent</b>
White	63.70 %
Hispanic	16.30 %
Black	12.20 %
Asian	4.70 %
Bi-Racial	1.90 %
Native	.70 %
Other	.20 %
Hawaiian	.15 %

### Value

Returns a random factor vector of elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
race(10)
100*table(race(n <- 10000))/n
```

---

relate

---

*Create Related Numeric Columns*

---

**Description**

Generate columns that are related.

**Usage**

```
relate(
  x,
  j,
  name = NULL,
  operation = "+",
  mean = 5,
  sd = 1,
  rep.sep = "_",
  digits = max(nchar(sub("^[^.]*.\"", "", x)))
)
```

**Arguments**

x	A starting column.
j	The number of columns to produce.
name	An optional prefix name to give to the columns. If NULL attempts to take from the varname attribute of x. If not found, "Variable" is used.
operation	A operation character vector of length 1; either c("+", "-", "*", "/"). This is the relationship between columns.
mean	Mean is the average value to add, subtract, multiple, or divide by.
sd	The amount of variability to allow in mean. Setting to 0 will constrain the operation between x_(n - 1) column and x_n to be exactly the mean value (see <b>Examples</b> for a demonstration).

rep.sep	A separator to use for repeated variable names. For example if the <code>age</code> is used three times ( <code>r_data_frame(age, age, age)</code> ), the name "Age" will be assigned to all three columns. The results in column names <code>c("Age_1", "Age_2", "Age_3")</code> .
digits	The number of digits to round to. Defaults to the max number of significant digits in <code>x</code> .

**Value**

Returns a `tbl_df`.

**See Also**

[r\\_series](#)

**Examples**

```
relate(1:10, 10)

(x <- r_data_frame(10, id, relate(1:10, 10, "Time", mean = 2)))
library(ggplot2)

dat <- with(x, data.frame(ID = rep(ID, ncol(x[, -1])), stack(x[, -1])))

```

---

religion

*Generate Random Vector of Religions*

---

**Description**

Generate a random vector of religion.

**Usage**

```
religion(
  n,
  x = c("Christian", "Muslim", "None", "Hindu", "Buddhist", "Folk", "Other", "Jewish"),
  prob = c(0.31477, 0.23163, 0.16323, 0.14985, 0.07083, 0.05882, 0.00859, 0.00227),
  name = "Religion"
)
```

**Arguments**

**n** The number elements to generate. This can be globally set within the environment of `r_data_frame` or `r_list`.

**x** A vector of elements to chose from.

**prob** A vector of probabilities to chose from.

**name** The name to assign to the output vector's `varname` attribute. This is used to auto assign names to the column/vector name when used inside of `r_data_frame` or `r_list`.

**Details**

The religion and probabilities used match approximate world religion make-up (from [Pew Research Center](#)). The default make up is:

<b>Religion</b>	<b>N</b>	<b>Percent</b>
Christian	2,173,260,000	31.48 %
Muslim	1,599,280,000	23.16 %
None	1,127,000,000	16.32 %
Hindu	1,034,620,000	14.99 %
Buddhist	489,030,000	7.08 %
Folk	406,140,000	5.88 %
Other	59,330,000	.86 %
Jewish	15,670,000	.23 %

**Value**

Returns a random factor vector of religion elements.

**References**

```
religion(10)
barplot(table(religion(10000)))
pie(table(religion(10000)))
```

---

<code>r_data</code>	<i>Pre-Selected Column Data Set</i>
---------------------	-------------------------------------

---

## Description

`r_data` - Generate a data set with pre-set columns selected.

`r_data_theme` - Generate a themed data set with pre-set columns.

## Usage

```
r_data(n = 500, ...)
```

```
r_data_theme(n = 100, data_theme = "the_works")
```

## Arguments

<code>n</code>	The length to pass to the randomly generated vectors (number of rows).
<code>data_theme</code>	A data theme. Currently selections include: <b>the_works</b> all available variable functions <b>survey</b> ID column plus 10 numeric 5-point Likert type response columns <b>survey2</b> ID column plus 10 5-point Likert type response columns
<code>...</code>	A set of optionally named arguments. Using <b>wakefield</b> variable functions require no name or call parenthesis.

## Details

The pre-selected columns include:

- ID
- Race
- Age
- Sex
- Hour
- IQ
- Height
- Died

The user may use `...` to add additional columns. `r_data` is a convenience function to quickly produce a data set. For more specific usage use the more flexible [r\\_data\\_frame](#) function.

**Value**

Returns a `tbl_df`.

**See Also**

`r_data_frame`

**Examples**

```
r_data()
r_data(10)
r_data(10, paragraph, Attending = valid)

peek(r_data_theme())
plot(r_data_theme(), flip=TRUE)

r_data_theme("survey")
r_data_theme("survey2")
```

---

r\_data\_frame

*Data Frame Production (From Variable Functions)*

---

**Description**

Produce a `tbl_df` data frame that allows the user to lazily pass unnamed **wakefield** variable functions (optionally, without call parenthesis).

**Usage**

```
r_data_frame(n, ..., rep.sep = "_")
```

**Arguments**

n	The length to pass to the randomly generated vectors.
rep.sep	A separator to use for repeated variable names. For example if the <code>age</code> is used three times ( <code>r_data_frame(age, age, age)</code> ), the name "Age" will be assigned to all three columns. The results in column names <code>c("Age_1", "Age_2", "Age_3")</code> . To turn of this behavior use <code>rep.sep = NULL</code> . This results in <code>c("Age", "Age.1", "Age.2")</code> column names in the <code>data.frame</code> .
...	A set of optionally named arguments. Using <b>wakefield</b> variable functions require no name or call parenthesis.

**Value**

Returns a `tbl_df`.

  dummy,
  grade_letter,
  gender,
  paragraph,
  sentence
) %>%
  r_na() %>%
  peek %>%
  plot(palette = "Set1")

```

---

r\_dummy

*Generate Random Dummy Values*

---

### Description

Generate random values from a **wakefield** variable function.

### Usage

```
r_dummy(fun, n, ..., prefix = FALSE, rep.sep = "_")
```

### Arguments

fun	A <b>wakefield</b> variable function.
n	The number of rows to produce.
prefix	logical. If TRUE the original factor name (supplied to fun as name argument) will prefix the column names that were generated from the factor's categories.

rep.sep      A separator to use for the variable and category part of names when prefix = TRUE. For example if the `age` is used (`r_dummy(sex)`), this results in column names `c("Sex_Male", "Sex_Female")`.

...          Additional arguments passed to fun.

**Value**

Returns a `tbl_df`.

**See Also**

[r\\_list](#), [r\\_data\\_frame](#), [r\\_series](#)

**Examples**

```
r_dummy(sex, 10)
r_dummy(race, 1000)
r_dummy(race, 1000, name = "Ethnicity")
```

---

r\_insert

---

*Insert Data Frames Into r\_data\_frame*

---

**Description**

Safely insert `data.frame` objects into a `r_data_frame` or `r_list`.

**Usage**

```
r_insert(x, name = "Inserted")
```

**Arguments**

`x`            A `data.frame` to add a `seriesname` attribute (i.e., `attributes(x)[["seriesname"]]`)

`name`        A name to assign to `attributes(x)[["seriesname"]]`.

**Value**

Returns a `data.frame` with a `attributes(x)[["seriesname"]]` assigned.

**See Also**

[seriesname](#)

**Examples**

```

dat <- dplyr::data_frame(
  Age_1 = age(100), Age_2 = age(100), Age_3 = age(100),
  Smokes = smokes(n=100),
  Sick = ifelse(Smokes, sample(5:10, 100, TRUE), sample(0:4, 100, TRUE)),
  Death = ifelse(Smokes, sample(0:1, 100, TRUE, prob = c(.2, .8)),
    sample(0:1, 100, TRUE, prob = c(.7, .3)))
)

r_data_frame(100,
  id,
  r_insert(dat)
)

r_list(10,
  id,
  r_insert(dat)
)

```

---

`r_list`*List Production (From Variable Functions)*

---

**Description**

Produce a named `list` that allows the user to lazily pass unnamed **wakefield** variable functions (optionally, without call parenthesis).

**Usage**

```
r_list(n, ..., rep.sep = "_")
```

**Arguments**

<code>n</code>	The length to pass to the randomly generated vectors.
<code>rep.sep</code>	A separator to use for repeated variable names. For example if the <code>age</code> is used three times ( <code>r_list(age, age, age)</code> ), the name "Age" will be assigned to all three vectors in the list. The results in column names <code>c("Age_1", "Age_2", "Age_3")</code> . To turn of this behavior use <code>rep.sep = NULL</code> . This results in <code>c("Age", "Age", "Age")</code> for vector names, leading to <code>c("Age", "Age.1", "Age.2")</code> if coerced to a <code>data.frame</code> .
<code>...</code>	A set of optionally named arguments. Using <b>wakefield</b> variable functions require no name or call parenthesis.

**Value**

Returns a named list of equal length vectors.

**Author(s)**

Josh O'Brien and Tyler Rinker <tyler.rinker@gmail.com>.

[r\\_data\\_frame](#), [r\\_series](#) [r\\_dummy](#)

**Examples**

```
r_list(  
  n = 30,  
  id,  
  race,  
  age,  
  sex,  
  hour,  
  iq,  
  height,  
  died,  
  Scoring = rnorm  
)  
  
r_list(  
  n = 30,  
  id,  
  race,  
  age(x = 8:14),  
  Gender = sex,  
  Time = hour,  
  iq,  
  height(mean=50, sd = 10),  
  died,  
  Scoring = rnorm  
)
```

---

r\_na

*Replace a Proportion of Values With NA*

---

**Description**

Replaces a proportion of values with NA. Useful for simulating missing data.

**Usage**

```
r_na(x, cols = -1, prob = 0.05)
```

**Arguments**

x	A <code>data.frame</code> or <code>list</code> to randomly replace elements with NAs.
cols	Numeric indices of the columns to include (use - to exclude as well). Default is to assign random NAs to all columns except the first column.
prob	The proportion of each column/vector elements to assign to NA.

**Value**

Returns a `data.frame` or `list` with random missing values.

**Examples**

```
r_na(mtcars)
r_na(mtcars, NULL)

library(dplyr)

r_data_frame(
  n = 30,
  id,
  race,
  age,
  sex,
  hour,
  iq,
  height,
  died,
  Scoring = rnorm,
  Smoker = valid
) %>%
  r_na(prob=.4)
```

---

`r_sample`*Generate Random Vector*

---

**Description**

Generate a random vector.

**Usage**

```
r_sample(n, x = 1:100, prob = NULL, name = "Sample")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of elements.

**See Also**

[sample](#)

**Examples**

```
r_sample(100, name = "Var")
table(r_sample(x = c("Dog", "Cat", "Fish", "Bird"), n=1000))
r_sample(x = c("B", "W"), prob = c(.7, .3), n = 25, name = "Race")
r_sample(25, x = c(TRUE, FALSE))
```

---

r_sample_binary	<i>Generate Random Binary Vector</i>
-----------------	--------------------------------------

---

**Description**

`r_sample_binary` - Generate a random binary vector.

`r_sample_binary_factor` - Generate a random binary vector and coerces to a factor.

**Usage**

```
r_sample_binary(n, x = 1:2, prob = NULL, name = "Binary")
```

```
r_sample_binary_factor(n, x = 1:2, prob = NULL, name = "Binary")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of length 2 to sample from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random binary vector of elements.

**See Also**

[sample.int](#)

**Examples**

```
r_sample_binary(100, name = "Var")
table(r_sample_binary(1000))
c("B", "W")[r_sample_binary(10)]
```

---

r_sample_factor	<i>Generate Random Factor Vector</i>
-----------------	--------------------------------------

---

**Description**

Generate a random vector and coerces to a factor.

**Usage**

```
r_sample_factor(n, x = LETTERS, prob = NULL, name = "Factor")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's varname attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random actor vector of elements.

**See Also**

[sample](#)

**Examples**

```
r_sample_factor(100, name = "Var")
table(r_sample_factor(x = c("Dog", "Cat", "Fish", "Bird"), n=1000))
r_sample_factor(x = c("B", "W"), prob = c(.7, .3), n = 25)
```

---

r_sample_integer	<i>Generate Random Integer Vector</i>
------------------	---------------------------------------

---

### Description

Generate a random integer vector.

### Usage

```
r_sample_integer(n, x = 1:100, prob = NULL, name = "Integer")
```

### Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

### Value

Returns a random integer vector of elements.

### See Also

[sample](#)

### Examples

```
r_sample_integer(100, name = "Var")
table(r_sample_integer(x = c("Dog", "Cat", "Fish", "Bird"), n=1000))
r_sample_integer(x = c("B", "W"), prob = c(.7, .3), n = 25, name = "Race")
r_sample_integer(25, x = c(TRUE, FALSE))
```

---

r\_sample\_logical      *Generate Random Logical Vector*

---

**Description**

Generate a random logical (TRUE/FALSE) vector.

**Usage**

```
r_sample_logical(n, prob = NULL, name = "Logical")
```

**Arguments**

**n**                    The number elements to generate. This can be globally set within the environment of `r_data_frame` or `r_list`.

**prob**                A vector of probabilities to chose from.

**name**                The name to assign to the output vector's `varname` attribute. This is used to auto assign names to the column/vector name when used inside of `r_data_frame` or `r_list`.

**Value**

Returns a random logical (TRUE/FALSE) vector of elements.

**See Also**

[sample](#)

**Examples**

```
r_sample_logical(100, name = "Var")
table(r_sample_logical(1000))
c("B", "W")[r_sample_logical(10)]
```

---

r\_sample\_ordered      *Generate Random Ordered Factor Vector*

---

**Description**

Generate a random vector and coerces to an ordered factor.

**Usage**

```
r_sample_ordered(n, x = LETTERS[1:5], prob = NULL, name = "Ordered")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random factor vector of elements.

**See Also**

[sample](#), [ordered](#)

**Examples**

```
r_sample_ordered(100, name = "Var")

lvls <- c("Strongly Agree", "Agree", "Neutral", "Disagree", "Strongly Disagree")
table(r_sample_ordered(x = lvls, n=1000))

(out <- r_sample_ordered(x = c("Black", "Grey", "White"),
  prob = c(.5, .2, .3), n = 100))
slices <- c(table(out))
pie(slices, main="Pie Chart of Colors", col = tolower(names(slices)))
```

---

r_sample_replace	<i>Generate Random Vector (Without Replacement)</i>
------------------	---

---

**Description**

Generate a random vector without replacement.

**Usage**

```
r_sample_replace(n, x = 1:100, prob = NULL, replace = FALSE, name = "Sample")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.

replace	logical. If TRUE sampling is done with replacement. Default is without replacement.
name	The name to assign to the output vector's varname attribute. This is used to auto assign names to the column/vector name when used inside of r_data_frame or r_list.

**Value**

Returns a random vector of elements.

**See Also**

[sample](#)

**Examples**

```
r_sample(100, name = "Var")
table(r_sample(x = c("Dog", "Cat", "Fish", "Bird"), n=1000))
r_sample(x = c("B", "W"), prob = c(.7, .3), n = 25, name = "Race")
r_sample(25, x = c(TRUE, FALSE))
```

---

r\_series

*Data Frame Series (Repeated Measures)*

---

**Description**

Produce a [tbl\\_df](#) data frame of repeated measures from a wakefield variable function.

**Usage**

```
r_series(fun, j, n, ..., integer = FALSE, relate = NULL, rep.sep = "_")
```

**Arguments**

fun	A <b>wakefield</b> variable function.
j	The number of columns to produce.
n	The number of rows to produce.
integer	logical. If TRUE factor columns will be coerced to integer.
relate	Allows the user to specify the relationship between columns. May be a named list of c("operation", "mean", "sd") or a string of the form of "fM_sd" where 'f' is one of (+, -, *, /), 'M' is a mean value, and 'sd' is a standard deviation of the mean value (e.g., "*4_1"). See <a href="#">relate</a> for details.
rep.sep	A separator to use for repeated variable names. For example if the <a href="#">age</a> is used three times (r_data_frame(age, age, age)), the name "Age" will be assigned to all three columns. The results in column names c("Age_1", "Age_2", "Age_3").
...	Additional arguments passed to fun.

**Value**

Returns a `tbl_df`.

**References**

**See Also**

`r_list`, `r_data_frame` `r_dummy`

**Examples**

```
r_series(grade, 5, 10)

## Custom name prefix
r_series(likert, 5, 10, name = "Question")

## Convert factors to integers
r_series(likert_7, 5, 10, integer = TRUE)

## Related variables
r_series(likert, 10, 200, relate = list(operation = "*", mean = 2, sd = 1))
r_series(likert, 10, 200, relate = "--3_1")
r_series(age, 10, 200, relate = "+5_0")

## Change sd to reduce/increase correlation
round(cor(r_series(grade, 10, 10, relate = "+1_2")), 2)
round(cor(r_series(grade, 10, 10, relate = "+1_0")), 2)
round(cor(r_series(grade, 10, 10, relate = "+1_.5")), 2)
round(cor(r_series(grade, 10, 10, relate = "+1_20")), 2)

## Plot Example 1
library(dplyr); library(ggplot2)

dat <- r_data_frame(12,
  name,
  r_series(likert, 10, relate = "+1_.5")
)

# Suggested use of tidyr or reshape2 package here instead
dat <- data.frame(
  ID = rep(dat[[1]], ncol(dat[-1])),
  stack(dat[-1])
)

dat[["Time"]] <- factor(sub("Variable_", "", dat[["ind"]]), levels = 1:10)
ggplot(dat, aes(x = Time, y = values, color = ID, group = ID)) +
  geom_line(size=.8)

## Plot Example 2
dat <- r_data_frame(12,
```

```

    name,
    r_series(grade, 100, relate = "+1_2")
  )

# Suggested use of tidyr or reshape2 package here instead
dat <- data.frame(
  ID = rep(dat[[1]], ncol(dat[-1])),
  ind = rep(colnames(dat[-1]), each = nrow(dat)),
  values = unlist(dat[-1])
)

dat[["Time"]] <- as.numeric(sub("Grade_", "", dat[["ind"]]))
ggplot(dat, aes(x = Time, y = values, color = ID, group = ID)) +
  geom_line(size=.8) + theme_bw()

```

sat

*Generate Random Vector of Scholastic Aptitude Test (SATs)***Description**

grade - Generate a random normal vector of scholastic aptitude test (SATs).

**Usage**

```
sat(n, mean = 1500, sd = 100, min = 0, max = 2400, digits = 0, name = "SAT")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
mean	The mean value for the normal distribution to be drawn from.
sd	The standard deviation of the normal distribution to draw from.
min	A numeric lower boundary cutoff. Results less than this value will be replaced with min.
max	A numeric upper boundary cutoff. Results greater than this value will be replaced with max.
digits	Integer indicating the number of decimal places to be used. Negative values are allowed (see <a href="#">round</a> ).
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random normal vector of SAT elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
sat(10)
hist(sat(10000))
interval(sat, 5, n = 1000)
```

---

second

---

*Generate a Random Sequence of Seconds in H:M:S Format*

---

**Description**

Generate a random vector of seconds in H:M:S format.

**Usage**

```
second(
  n,
  x = seq(0, 59, by = 1)/3600,
  prob = NULL,
  random = FALSE,
  name = "Second"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
random	logical. If TRUE the times are randomized, otherwise the times are sequential.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of second time elements in H:M:S format.

**See Also**[times](#)**Examples**

```
second(20)
second(20, random=TRUE)
pie(table(second(2000, x = seq(0, 59, by = 10)/3600, prob = probs(6))))
```

---

sentence

*Generate Random Vector of Sentences*

---

**Description**

Generate a random vector of sentences from the [presidential\\_debates\\_2012](#).

**Usage**

```
sentence(
  n,
  x = wakefield::presidential_debates_2012,
  prob = NULL,
  name = "Sentence"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random character vector of sentence elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
sentence(10)
```

---

seriesname	<i>Add Internal Name to Data Frame</i>
------------	--

---

**Description**

Adds `attributes(x)[["seriesname"]]` attribute to a `data.frame`.

**Usage**

```
seriesname(x, name)
```

**Arguments**

`x` A `data.frame` to add a `seriesname` attribute (i.e., `attributes(x)[["seriesname"]]`)  
`name` A name to assign to `attributes(x)[["seriesname"]]`.

**Value**

Returns a `data.frame` with a `attributes(x)[["seriesname"]]` assigned.

**Examples**

```
seriesname(mtcars, "Cars")
attributes(seriesname(mtcars, "Cars"))
```

---

sex	<i>Generate Random Vector of Genders</i>
-----	--

---

**Description**

Generate a random vector of genders.

**Usage**

```
sex(
  n,
  x = c("Male", "Female"),
  prob = c(0.51219512195122, 0.48780487804878),
  name = "Sex"
)

gender(
  n,
```

```
x = c("Male", "Female"),
prob = c(0.51219512195122, 0.48780487804878),
name = "Gender"
)
```

### Arguments

**n** The number elements to generate. This can be globally set within the environment of `r_data_frame` or `r_list`.

**x** A vector of length 2 to sample from.

**prob** A vector of probabilities to chose from.

**name** The name to assign to the output vector's `varname` attribute. This is used to auto assign names to the column/vector name when used inside of `r_data_frame` or `r_list`.

### Details

The genders and probabilities used match approximate gender make-up:

Gender	Percent
Male	51.22 %
Female	48.78 %

### Value

Returns a random factor vector of gender elements.

### See Also

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

### Examples

```
sex(10)
100*table(sex(n <- 10000))/n
```

---

sex\_inclusive                      *Generate Random Vector of Non-Binary Genders*

---

### Description

Generate a random vector of non-binary genders. Proportion of trans\* category was taken from the [Williams Institute Report](#) (2011), and subtracted equally from the male and female categories.

### Usage

```
sex_inclusive(
  n,
  x = c("Male", "Female", "Intersex"),
  prob = NULL,
  name = "Sex"
)

gender_inclusive(
  n,
  x = c("Male", "Female", "Trans*"),
  prob = NULL,
  name = "Gender"
)
```

### Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

### Details

The genders and probabilities used match approximate gender make-up:

Gender	Percent
Male	51.07 %
Female	48.63 %
Trans*	0.30 %

### Value

Returns a random factor vector of sex or gender elements.

```
sex_inclusive(10)
barplot(table(sex_inclusive(10000)))

gender_inclusive(10)
barplot(table(gender_inclusive(10000)))
```

---

smokes

*Generate Random Logical Smokes Vector*

---

**Description**

Generate a random logical (TRUE/FALSE) smokes vector.

**Usage**

```
smokes(n, prob = c(0.822, 0.178), name = "Smokes")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Details**

The probabilities are non-smoker: 82.2% vs. smoker: 17.8%.

**Value**

Returns a random logical vector of smokes elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
smokes(10)
100*table(smokes(n <- 1000))/n
```

---

speed

*Generate Random Vector of Speeds*

---

**Description**

speed and speed\_in - Generate a random normal vector of speeds in inches.

speed\_cm - Generate a random normal vector of speeds in centimeters.

**Usage**

```
speed(n, mean = 55, sd = 10, min = 0, max = NULL, digits = 0, name = "Speed")
```

```
speed_mph(
  n,
  mean = 55,
  sd = 10,
  min = 0,
  max = NULL,
  digits = 1,
  name = "Speed(mph)"
)
```

```
speed_kph(
  n,
  mean = 88.5,
  sd = 16,
  min = 0,
  max = NULL,
  digits = 1,
  name = "Speed(kph)"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
mean	The mean value for the normal distribution to be drawn from.
sd	The standard deviation of the normal distribution to draw from.
min	A numeric lower boundary cutoff. Results less than this value will be replaced with <code>min</code> .
max	A numeric upper boundary cutoff. Results greater than this value will be replaced with <code>max</code> .
digits	Integer indicating the number of decimal places to be used. Negative values are allowed (see <a href="#">round</a> ).
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random normal vector of speed elements.

**Note**

`speed` rounds to nearest whole number. `speed_in` & `speed_in` round to the nearest tenths.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
speed(10)
hist(speed(10000))
interval(speed, 5, n = 1000)
```

---

state

*Generate Random Vector of states*

---

**Description**

Generate a random factor vector of states.

**Usage**

```
state(
  n,
  x = datasets::state.name,
  prob = wakefield::state_populations[["Proportion"]],
  name = "State"
)
```

**Arguments**

**n** The number elements to generate. This can be globally set within the environment of `r_data_frame` or `r_list`.

**x** A vector of elements to chose from.

**prob** A vector of probabilities to chose from.

**name** The name to assign to the output vector's `varname` attribute. This is used to auto assign names to the column/vector name when used inside of `r_data_frame` or `r_list`.

**Details**

The state populations and probabilities:

<b>State</b>	<b>Population</b>	<b>Percent</b>
California	37,253,956	12.09 %
Texas	25,145,561	8.16 %
New York	19,378,102	6.29 %
Florida	18,801,310	6.10 %
Illinois	12,830,632	4.16 %
Pennsylvania	12,702,379	4.12 %

```
state(10)
pie(table(state(10000)))
sort(100*table(state(n <- 10000))/n)
```

---

state_populations	<i>State Populations (2010)</i>
-------------------	---------------------------------

---

**Description**

A dataset containing U.S. state populations.

**Usage**

```
data(state_populations)
```

**Format**

A data frame with 50 rows and 3 variables

**Details**

- State. The 50 U.S. states.
- Population. Population of state.
- Proportion. Proportion of total U.S. population.

**References**

[https://en.wikipedia.org/wiki/List\\_of\\_U.S.\\_states\\_and\\_territories\\_by\\_population](https://en.wikipedia.org/wiki/List_of_U.S._states_and_territories_by_population)

---

string	<i>Generate Random Vector of Strings</i>
--------	--

---

**Description**

Generate a random vector of strings.

**Usage**

```
string(n, x = "[A-Za-z0-9]", length = 10, name = "String")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A character vector specifying character classes to draw elements from.
length	Integer vector, desired string lengths.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random character vector of string elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```
string(10)
```

---

table_heat	<i>View Data Table Column Types as Heat Map</i>
------------	---

---

**Description**

Generate a heat map of column types from a [data.frame](#).

**Usage**

```
table_heat(
  x,
  flip = FALSE,
  palette = "Set3",
  print = interactive(),
  sep = "\n"
)
```

**Arguments**

x	A <a href="#">data.frame</a> .
flip	logical. If TRUE the <a href="#">data.frame</a> is flipped so that the columns are on the y axis and observations on the x axis. This is useful when there are many columns or the column names are longer.
palette	A palette to chose from. See <a href="#">scale_fill_brewer</a> for more. These choices should exceed the number of unique column types. Use NULL to use <b>ggplot2</b> 's default color scheme.
print	logical. If TRUE the pot is printed. Option for use in document construction such as <b>knitr</b> or <b>rmarkdown</b> .
sep	A separator to use between column types. Column types are determined via <code>sapply(x, class)</code> . When multiple types are present these are collapsed. By default the <code>\n</code> is used.

## Details

By default column names retain their order. Column types are ordered alphabetically in the legend, with NA appearing last.

## Value

Returns a **ggplot2** object.

## Examples

```
table_heat(mtcars) #boring
table_heat(CO2)
table_heat(iris)
table_heat(state_populations)

dat <- r_data_frame(100,
  lorem_ipsum,
  birth,
  animal,
  age,
  grade, grade,
  death,
  dummy,
  grade_letter
)

table_heat(dat)
table_heat(dat, flip=TRUE)

table_heat(r_data_theme(), flip=TRUE)

## NA values
table_heat(r_na(dat, NULL))

## Colors
table_heat(r_na(dat, NULL), palette = NULL)
table_heat(r_na(dat, NULL), palette = "Set1")
table_heat(r_na(dat, NULL), palette = "Set2")
table_heat(r_na(dat, NULL), palette = "Set1")
table_heat(r_na(dat, NULL), palette = "Dark2")
table_heat(r_na(dat, NULL), palette = "Spectral")
table_heat(r_na(dat, NULL), palette = "Reds")
```

---

time\_stamp

*Generate a Random Sequence of Times in H:M:S Format*

---

## Description

Generate a random vector of times in H:M:S format.

**Usage**

```
time_stamp(
  n,
  x = seq(0, 23, by = 1),
  prob = NULL,
  random = FALSE,
  name = "Time"
)
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
random	logical. If TRUE the times are randomized, otherwise the times are sequential.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of time elements in H:M:S format.

**See Also**

[times](#)

**Examples**

```
time_stamp(20)
time_stamp(20, random=TRUE)
pie(table(time_stamp(2000, x = seq(0, 23, by = 2), prob = probs(12))))
```

---

upper

*Generate Random Letter Vector*

---

**Description**

upper - Generates a random character vector of upper case letters.  
 lower - Generates a random character vector of lower case letters.  
 upper\_factor - Generates a random factor vector of upper case letters.  
 lower\_factor - Generates a random factor vector of lower case letters.

**Usage**

```

upper(n, k = 5, x = LETTERS, prob = NULL, name = "Upper")

lower(
  n,
  k = 5,
  x = c("a", "b", "c", "d", "e", "f", "g", "h", "i", "j", "k", "l", "m", "n", "o", "p",
        "q", "r", "s", "t", "u", "v", "w", "x", "y", "z"),
  prob = NULL,
  name = "Lower"
)

upper_factor(n, k = 5, x = LETTERS, prob = NULL, name = "Upper")

lower_factor(
  n,
  k = 5,
  x = c("a", "b", "c", "d", "e", "f", "g", "h", "i", "j", "k", "l", "m", "n", "o", "p",
        "q", "r", "s", "t", "u", "v", "w", "x", "y", "z"),
  prob = NULL,
  name = "Lower"
)

```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
k	The number of the elements of <code>x</code> to sample from (uses 1:k).
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random character/factor vector of letter elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [valid\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```

upper(10)
lower(10)
upper_factor(10)
lower_factor(10)
barplot(table(upper(10000)))
barplot(table(upper(10000, prob = probs(5))))

```

---

<code>valid</code>	<i>Generate Random Logical Vector</i>
--------------------	---------------------------------------

---

**Description**

Generate a random logical (TRUE/FALSE) vector.

**Usage**

```
valid(n, prob = NULL, name = "Valid")
```

**Arguments**

<code>n</code>	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
<code>prob</code>	A vector of probabilities to chose from.
<code>name</code>	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random logical vector of elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [year\(\)](#), [zip\\_code\(\)](#)

**Examples**

```

valid(10)
100*table(valid(n <- 1000))/n

```

---

variables

*Available Variable Functions*

---

### Description

See a listing of all available variable functions for use in `r_data_frame` or `r_list`.

### Usage

```
variables(type = NULL, ncols = 5, ...)
```

### Arguments

<code>type</code>	The output type. Must be either <code>NULL</code> (returns a character vector), <code>"matrix"</code> , or <code>"list"</code> ; or the user may extract a specific type from a list using: <code>"character"</code> , <code>"date"</code> , <code>"factor"</code> , <code>"integer"</code> , <code>"logical"</code> , <code>"numeric"</code> , <code>"ordered factor"</code> . Setting <code>type = TRUE</code> will also return a <code>list</code> . The <code>list</code> version breaks the variable functions into classes. Specifying a specific class (e.g., <code>type = "numeric"</code> ) will list only variable functions that yield a numeric output.
<code>ncols</code>	The number of columns to use if <code>type = "matrix"</code> .
<code>...</code>	Other arguments passed to <code>matrix</code> .

### Value

Returns a `character` vector, `matrix` of all variable functions, or a `list` of variable functions by type.

### Examples

```
variables()

variables("list")
variables(TRUE)
names(variables("list"))
variables("ordered factor")
variables("numeric")

variables("matrix")
variables("matrix", ncols=3)
variables("matrix", 1)
variables("matrix", byrow = TRUE)
```

---

varname	<i>Add Internal Name to Vector</i>
---------	------------------------------------

---

**Description**

Adds the class variable and an internal `attributes(x)[["varname"]]` attribute to a vector.

**Usage**

```
varname(x, name)
```

**Arguments**

x	A vector to add a varname attribute (i.e., <code>attributes(x)[["varname"]]</code> )
name	A name to assign to <code>attributes(x)[["varname"]]</code> .

**Value**

Returns a vector of the class variable with a `attributes(x)[["varname"]]` assigned.

**Examples**

```
varname(1:10, "A")
attributes(varname(1:10, "A"))
sum(varname(1:10, "A"))

varname(LETTERS, "Caps")
attributes(varname(LETTERS, "Caps"))
paste(varname(LETTERS, "Caps"), collapse="")
```

---

wakefield	<i>Generate Random Data Sets</i>
-----------	----------------------------------

---

**Description**

Generates random data sets including: `data.frames`, lists, and vectors.

---

year

*Generate Random Vector of Years*

---

## Description

Generate a random vector of years.

## Usage

```
year(  
  n,  
  x = 1996:as.numeric(format(Sys.Date(), "%Y")),  
  prob = NULL,  
  name = "Year"  
)
```

## Arguments

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

## Value

Returns a random vector of year elements.

## See Also

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [zip\\_code\(\)](#)

## Examples

```
year(10)  
pr <- probs(length(1996:2016))  
pie(table(year(10000, x= 1996:2016, prob = pr)))
```

---

zip_code	<i>Generate Random Vector of Zip Codes</i>
----------	--

---

**Description**

Generate a random vector of zip codes.

**Usage**

```
zip_code(n, k = 10, x = 10000:99999, prob = NULL, name = "Zip")
```

**Arguments**

n	The number elements to generate. This can be globally set within the environment of <code>r_data_frame</code> or <code>r_list</code> .
k	The number of the elements of <code>x</code> to sample from (uses <code>sample(x, k)</code> ).
x	A vector of elements to chose from.
prob	A vector of probabilities to chose from.
name	The name to assign to the output vector's <code>varname</code> attribute. This is used to auto assign names to the column/vector name when used inside of <code>r_data_frame</code> or <code>r_list</code> .

**Value**

Returns a random vector of zip code elements.

**See Also**

Other variable functions: [age\(\)](#), [animal\(\)](#), [answer\(\)](#), [area\(\)](#), [car\(\)](#), [children\(\)](#), [coin\(\)](#), [color](#), [date\\_stamp\(\)](#), [death\(\)](#), [dice\(\)](#), [dna\(\)](#), [dob\(\)](#), [dummy\(\)](#), [education\(\)](#), [employment\(\)](#), [eye\(\)](#), [grade\\_level\(\)](#), [grade\(\)](#), [group\(\)](#), [hair\(\)](#), [height\(\)](#), [income\(\)](#), [internet\\_browser\(\)](#), [iq\(\)](#), [language](#), [level\(\)](#), [likert\(\)](#), [lorem\\_ipsum\(\)](#), [marital\(\)](#), [military\(\)](#), [month\(\)](#), [name](#), [normal\(\)](#), [political\(\)](#), [race\(\)](#), [religion\(\)](#), [sat\(\)](#), [sentence\(\)](#), [sex\\_inclusive\(\)](#), [sex\(\)](#), [smokes\(\)](#), [speed\(\)](#), [state\(\)](#), [string\(\)](#), [upper\(\)](#), [valid\(\)](#), [year\(\)](#)

**Examples**

```
zip_code(10)
pie(table(zip_code(10000, prob = probs(10))))
```
